To study the structure of the nucleus is to study the quantum-mechanical finite many-body problem

- In the 63 years from 1900 to 1963 we went “from quantum to quark”—three fundamental levels of organization of matter (atomic, nuclear, hadronic).
- In the 63 years from 1952 to 2015 we went “from the collective model of the nucleus to the collective model of the nucleus”--!?
- Observation: the study of many-body quantum systems is enormously more complicated than the study of one-body quantum systems.

Shape Coexistence in Nuclei: origin of the idea

PHYSICAL REVIEW

VOLUME 101, NUMBER 1

JANUARY 1, 1956

Interpretation of Some of the Excited States of $4n$ Self-Conjugate Nuclei*

H. MORINAGA†

Department of Physics, Purdue University, Lafayette, Indiana

(Received August 5, 1955)

An attempt is made to give a general account for some of the excited levels of $4n$ -type self-conjugate light nuclei, especially for characteristic low-lying 0^+ levels and also for the 2^+ levels which appear not too far above the 0^+ levels in every case except the O^{16} ground state. It is pointed out that these 2^+ levels may arise from the same configuration as the lower lying 0^+ states which are considered to be deformed. The degree of deformation is estimated from the $0^+ - 2^+$ energy separation and found to correspond to quite high deformations in some cases. The 6.06-Mev, 0^+ , pair emitting state in O^{16} , which is considered to be a “hole configuration” by Christy and Fowler, may be deformed and is suspected to have a shape like a line of four alpha particles. Also, a rotation-like series of levels with spins and parities, 0^+ , 1^- , 2^+ , 3^- , and 4^+ among the highly excited states of Mg^{24} which appears to correspond to a series expected for a linear rotator with six alpha particles in a line is discussed. With Ne^{20} , indications of medium-deformed states are found. Analogous discussions on the levels in Be^8 and C^{12} are tried although the experimental evidence is less conclusive.

The 6.06-Mev, 0^+ ... state in O^{16} , ... may be deformed ...

† On leave from the University of Tokyo, Tokyo, Japan.

Shape coexistence in ^{16}O , ca. 2010

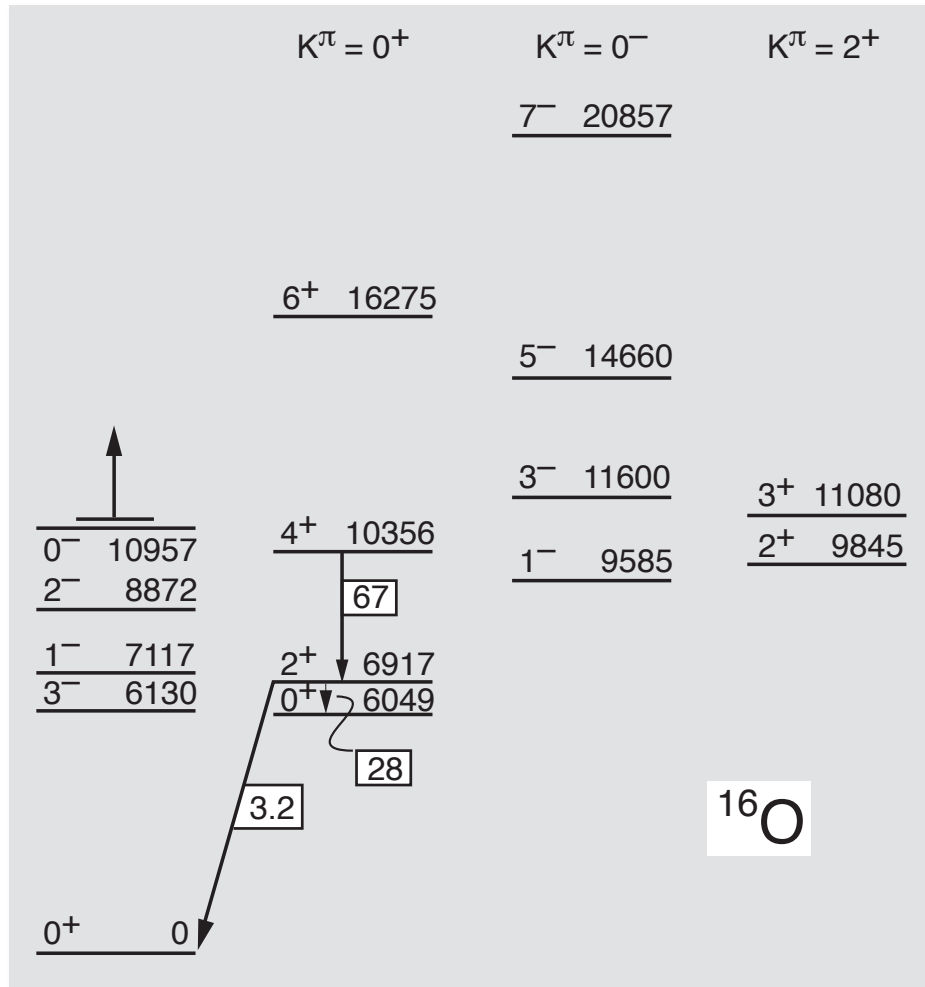

Figure from Rowe & Wood

Energies of states are given in keV.

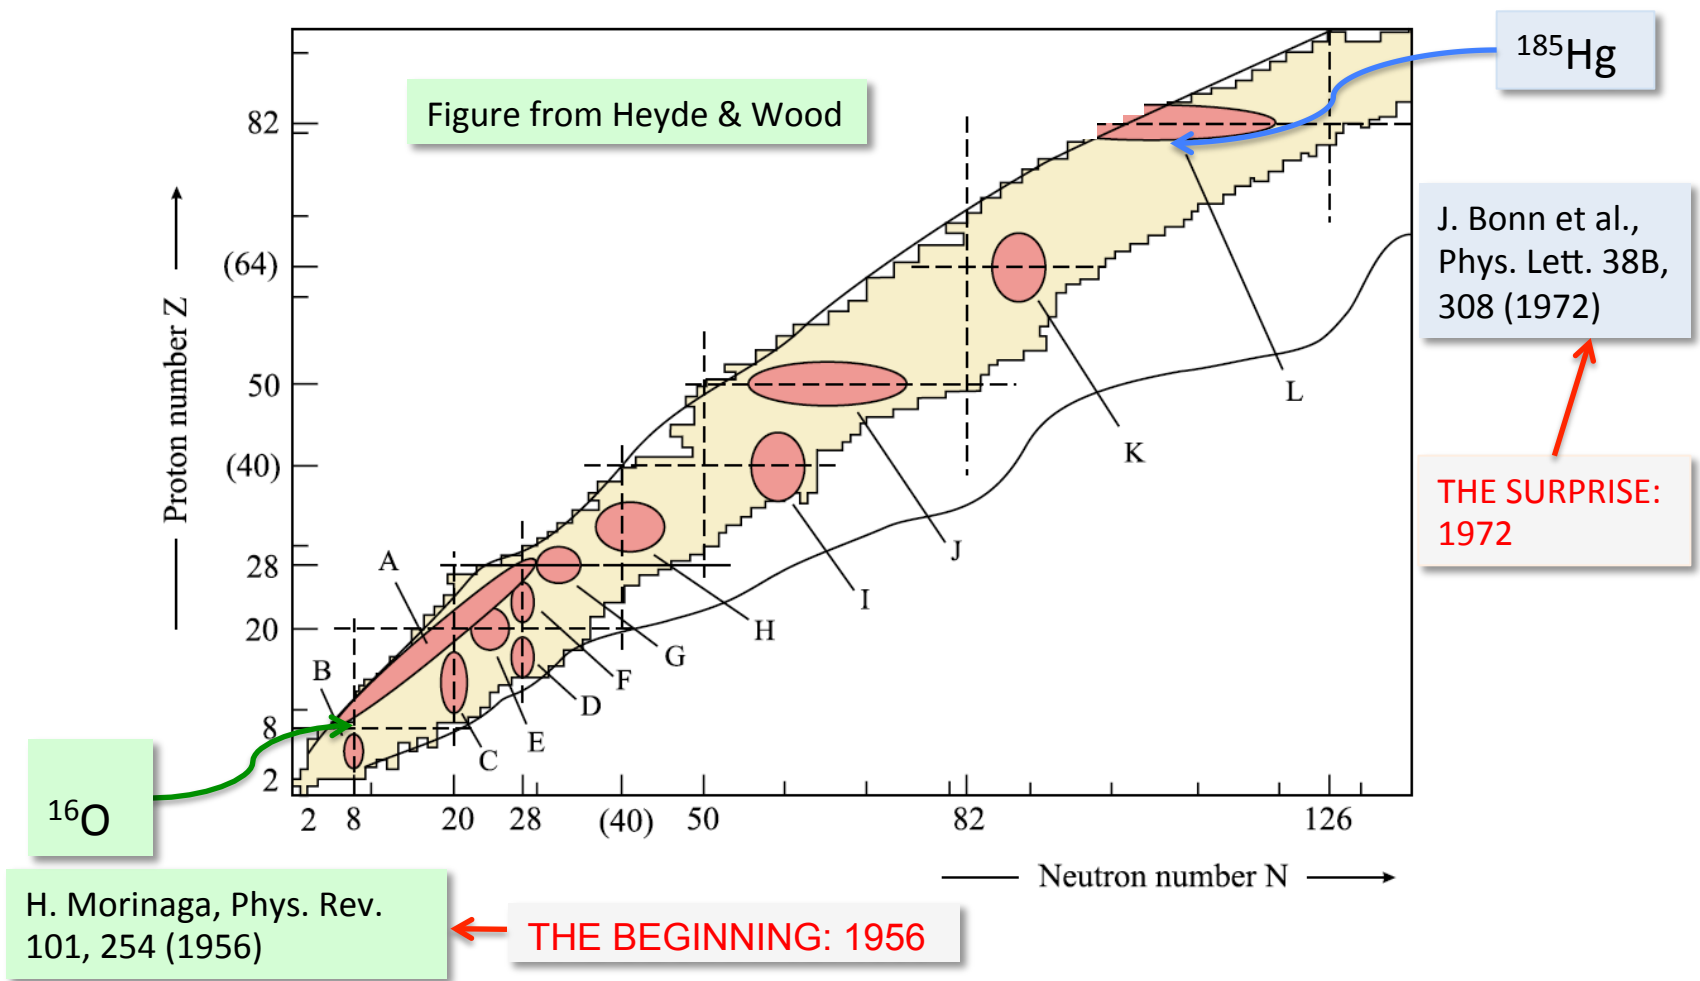

$B(E2)$ values are given in W.u.

States on the far left are spherical.

The beginnings of three deformed bands, with $K = 0, 0, 2$, are shown.

--Morinaga-san was right!

Coexistence: where we have been

Coexistence: Synopsis of this talk

- **An overview of the Pt – Pb ($Z = 82$) region:**
 - ★ the region with by far the most widely characterized manifestation of shape coexistence in nuclei
 - ★ a region that demanded development of techniques for rare isotope studies
 - ★ a region where deformed states “intrude” below the expected spherical states
- **A view of the $^{32}\text{Mg} - ^{48}\text{Ca}$ ($N, Z = 20$) region:**

is the spherical shell at $N = 20$ really breaking down?
- **A brief view of the ^{100}Zr region:**

when do subshells produce coexistence?

Isotope shifts in the Pb, Hg, and Pt isotopes and the ^{185}Hg isomer shift

$^{185}\text{Hg} / ^{186}\text{Hg}$ isotope shift
J. Bonn et al., Phys. Lett. B
38, 308 (1972)

$^{185}\text{Hg}^m / ^{185}\text{Hg}^g$ isomer shift
P. Dabkiewicz et al., Phys. Lett. B
82, 199 (1979)

Shape coexistence in the even-Hg isotopes:

NOTE characteristic *parabolic energy trend*

Proton single-hole / particle states near Z = 82

$$2d_{5/2}^{-1} \frac{5/2^+}{1.67}$$

$$1h_{11/2}^{-1} \frac{11/2^-}{1.34}$$

$$2d_{3/2}^{-1} \frac{3/2^+}{0.35}$$

$$3s_{1/2}^{-1} \frac{1/2^+}{0.00}$$

E(MeV)

$$1i_{13/2}^{+1} \frac{13/2^+}{1.61}$$

$$2f_{7/2}^{+1} \frac{7/2^-}{0.90}$$

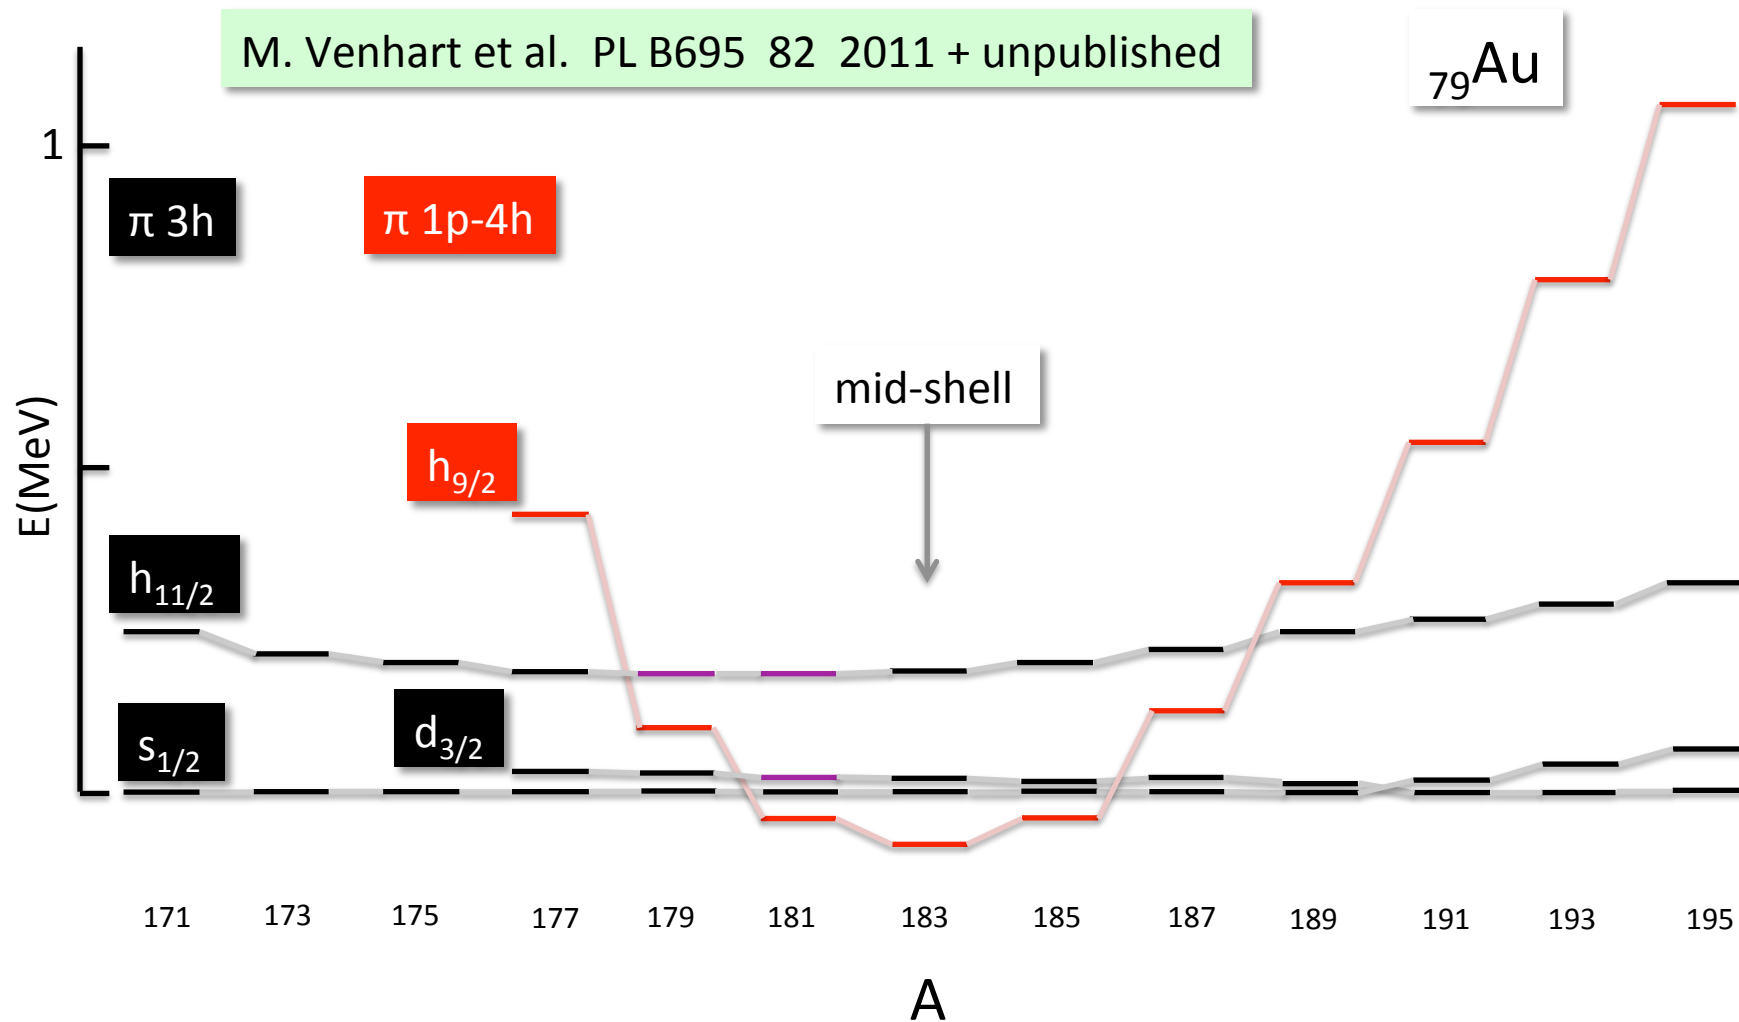

$$1h_{9/2}^{+1} \frac{9/2^-}{0.00}$$

$$0^+ \frac{0.00}{}$$

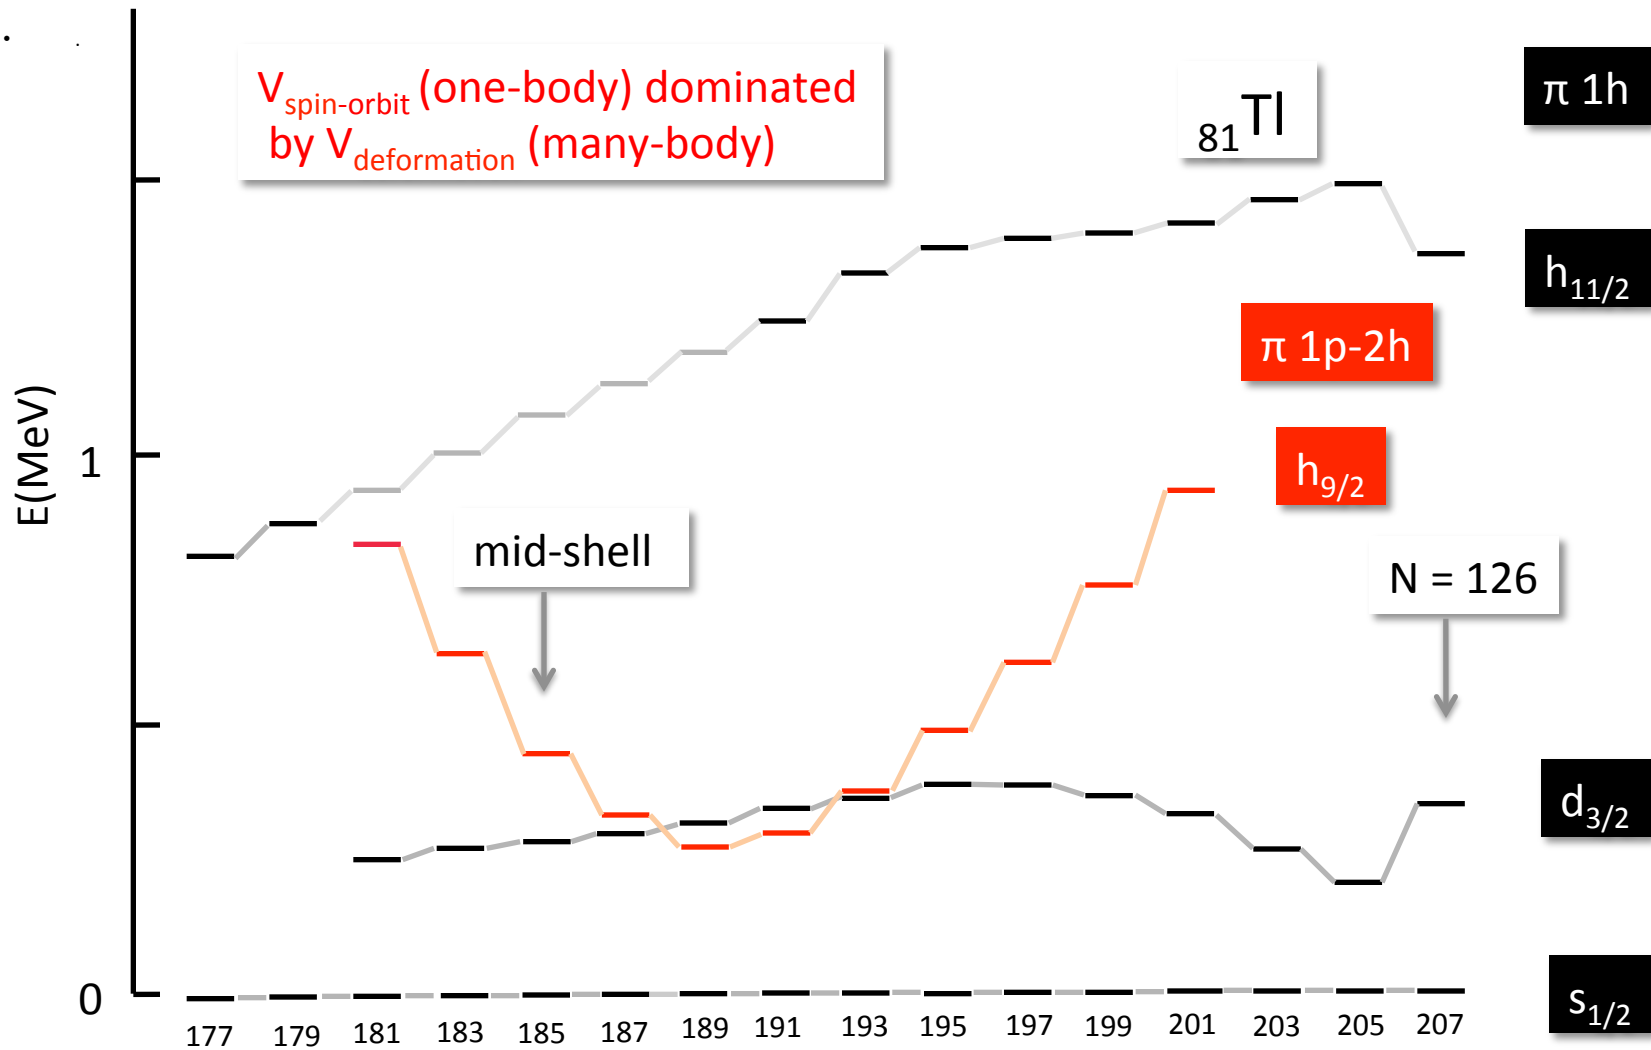

Odd-Au isotopes: $h_{9/2}$ “intruder” state

NOTE characteristic *parabolic energy trend*

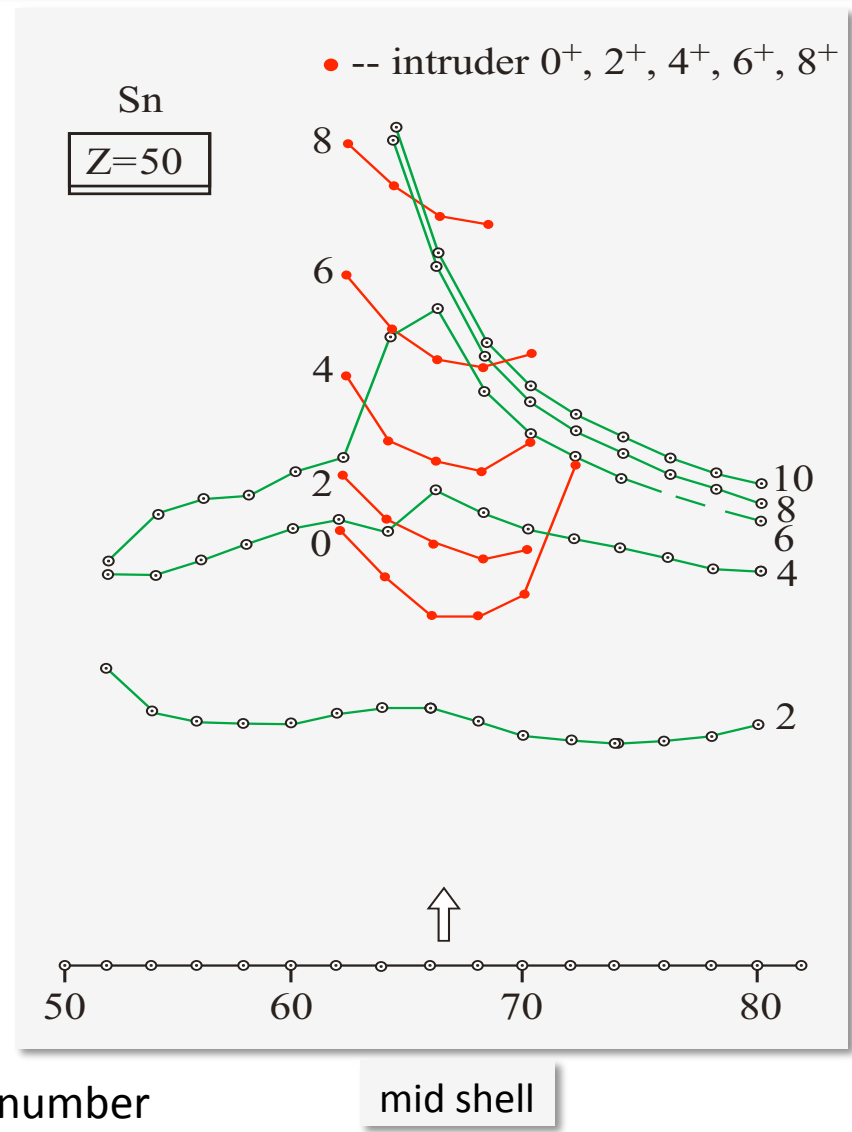

Odd-Tl isotopes:

NOTE the $h_{9/2}$ state lies *below* the $h_{11/2}$ state

Even Pb and Sn isotopes:

green—yrast states (easily seen); red—non-yrast states (seen with difficulty)

Energy contributions to a $\pi(2p-2h)$ intruder state in the Pb isotopes

Deformation in Zr isotopes, $50 \leq N \leq 62$

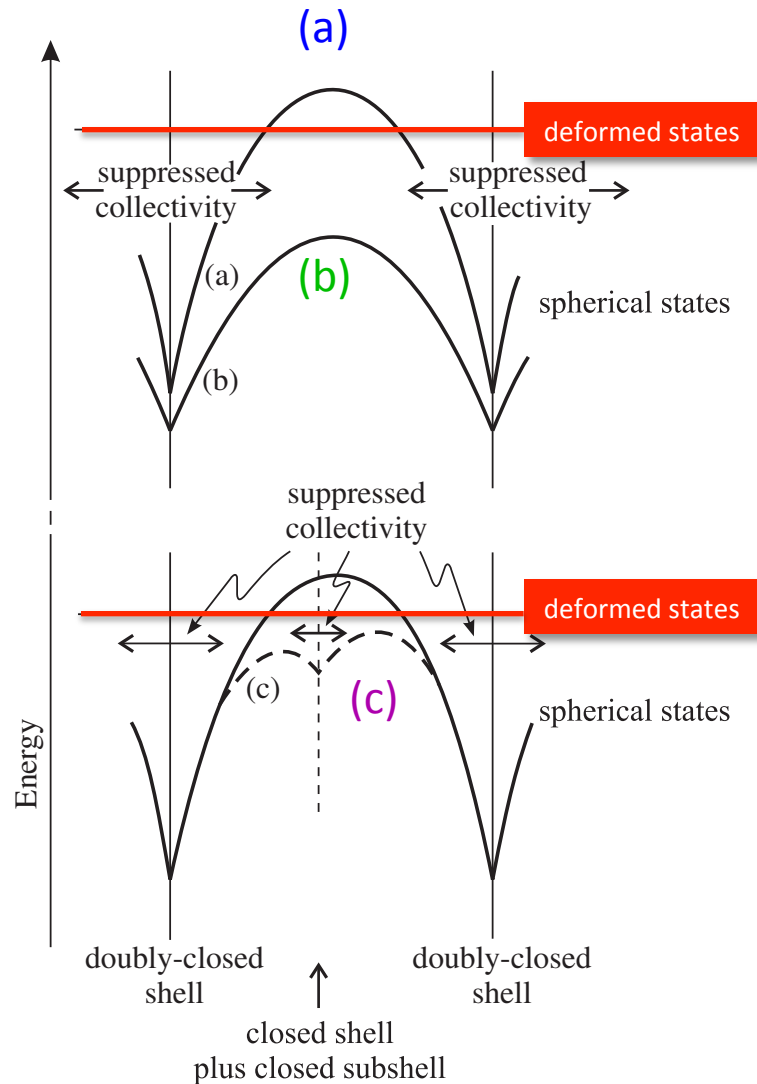

A deformed structure can intrude to become a ground state

Nuclei are manifestations of coexisting structures that may invert by addition of a few nucleons, and may mix.

Proton pair excitations with respect to the $Z = 40$ subshell

Shape coexistence at shell and subshell gaps: the suppression of collectivity—**THE MESSAGE**

Shape coexistence in regions such as:

(a) ^{32}Mg

(b) $^{180-196}\text{Pb}$

(c) $^{90-98}\text{Zr}$

Figure from Heyde & Wood

Shape coexistence: Conclusions

- ★ Shape coexistence probably occurs in all nuclei.
- ★ Shape coexistence can occur at low energy in the regions of shell energy gaps and subshell energy gaps.
- ★ In order to move towards a unified (and complete) view of the collective model of the nucleus, experimental and theoretical work on shape coexistence is essential.
- ★ **CONTENTION:** deformation is the universal norm of all nuclei (sphericity is a special case of “deformation”).
