## Curvature of the pseudocritical line in (2+1)-flavor QCD with HISQ fermions

*Tuesday, 14 July 2015 14:40 (20 minutes)*

We study QCD with (2 + 1) HISQ fermions at nonzero temperature and nonzero imaginary baryon chemical potential.

Monte Carlo simulations are performed using the MILC code along the line of constant physics with a light to strange mass ratio of  $m_l/m_s=1/20$  on lattices up to  $48^3 \times 12$  to check for finite cutoff effects.

We determine the curvature of the pseudocritical line extrapolated to the continuum limit.
