Exploring the effects of open boundary conditions on baryonic observables

Saturday, 18 July 2015 10:00 (20 minutes)

We explore the effects of open boundary conditions, as used in the CLS $N_f = 2+1$ ensembles, on nucleon two- and three-point functions, with a view towards studying nucleon form factors on these ensembles. Particular emphasis is put on controlling systematic effects due to the boundaries and excited states, and to the approach to the physical point.
