

A New version of One-Boson-Exchange Baryon-Baryon Potential Model

Shoji SHINMURA

Gifu University, JAPAN

Introduction

A New Version of OBEP with LQCD core

S=-2 $\Lambda\Lambda$ and ΞN interactions

Predictions for S=-3,-4 BB interactions

Summary

HYP2015@Tohoku, Sept. 7-11, 2015

Introduction : theoretical models of BB interactions

Potential model based on LQCD calculations

Direct results from fundamental theory

(Not only short-range part, but also long-range part)

HAL-QCD group

Hadron-exchange models with flavor-SU(3) symmetry

Long-range part: hadronic mechanism

Short-range part: 'short-range physics'

Phenomenological core (form factors)

NSC, Julich, [FG\(old version\)](#), etc,

Quark-model : fss, new ESC, etc

LQCD core : [Our new model](#)

Chiral Perturbation models

Reordering based on chiral symmetry

Entem et al, Epelbaum et al., Heidenbauer et al.

They play complementary roles

Introduction: Experimental knowledge on BB interactions

Two-body Scattering

Phase shift analyses : NN scattering New version SAID

Cross sections : YN scattering

Old data for $\Lambda N, \Sigma N - \Sigma N, \Sigma N - \Lambda N$ and $\Sigma^+ p$ KEK data

Single Hypernuclear Spectroscopy KEK, JLab, J-PARC, etc

s- and p-shell hypernuclear data → Effective ΛN int.

Mirror hypernuclei → CSB components

Σ -hypernuclei → ΣN interaction

$\Lambda\Lambda$ hypernuclei and Ξ -hypernuclei KEK, J-PARC

Nagara, Mikage events → $\Lambda\Lambda$ interaction

Kiso event → ΞN interaction

Talk by Nakazawa
this morning

BB potential models must explain S=-2 hypernuclear data.

model-dependent(Indirect)

Hadron-Hadron(H-H) Interactions at Low Energies

Baryon-Baryon Interactions

S= 0 NN

S=-1 $\Lambda N - \Sigma N$

S=-2 $\Xi N - \Lambda\Lambda - \Lambda\Sigma - \Sigma\Sigma$

S=-3 $\Xi\Lambda - \Xi\Sigma$

S=-4 $\Xi\Xi$

Meson-Baryon Interactions

S= 1 KN

S= 0 $\pi N - \eta N - K\Lambda - K\Sigma$

S=-1 $K^{\bar{N}} - \pi\Lambda - \pi\Sigma - \eta\Lambda - \eta\Sigma - K\Xi$

S=-2 $\pi\Xi - \eta\Xi - K^{\bar{\Lambda}}\Lambda - K^{\bar{\Sigma}}\Sigma$

S=-3 $K^{\bar{\Xi}}\Xi$

Meson-Meson Interactions

S= 2 KK

S= 1 $K\pi - K\eta$

S= 0 $\pi\pi - K^{\bar{K}}K - \eta\pi - \eta\eta$

S=-1 $K^{\bar{\pi}}\pi - K^{\bar{\eta}}\eta$

S=-2 $K^{\bar{K}}K^{\bar{K}}$

Coupled-Channel Problems

Construction of
Coupled -Channel
Potentials

Two-body systems

Three-body systems

Many-body systems

Our Goal: to construct a Unified Model

OBE model of baryon-baryon interactions

Old version:

OBEP with cutoff($r_c=0.4\text{fm}$)

+ SU(3)-symmetric phenomenological short-range core

New version:

OBEP with cutoff ($r_c=0.4\text{fm}$)

+ LQCD-based short-range core

$$V = V_{\text{core}}(r) + (1 - \exp(-(r/r_c)^2))^4 V_{\text{OBEP}}$$

$$V_{\text{core}}(r) = V_c \exp(-(r/r_g)^2)$$

In both versions, V_{OBEP} are defined in the same framework:

ps, s, v-meson-exchange with physical masses and widths

Exactly flavor-SU(3)-symmetric coupling constants

LQCD-based cores in the new version

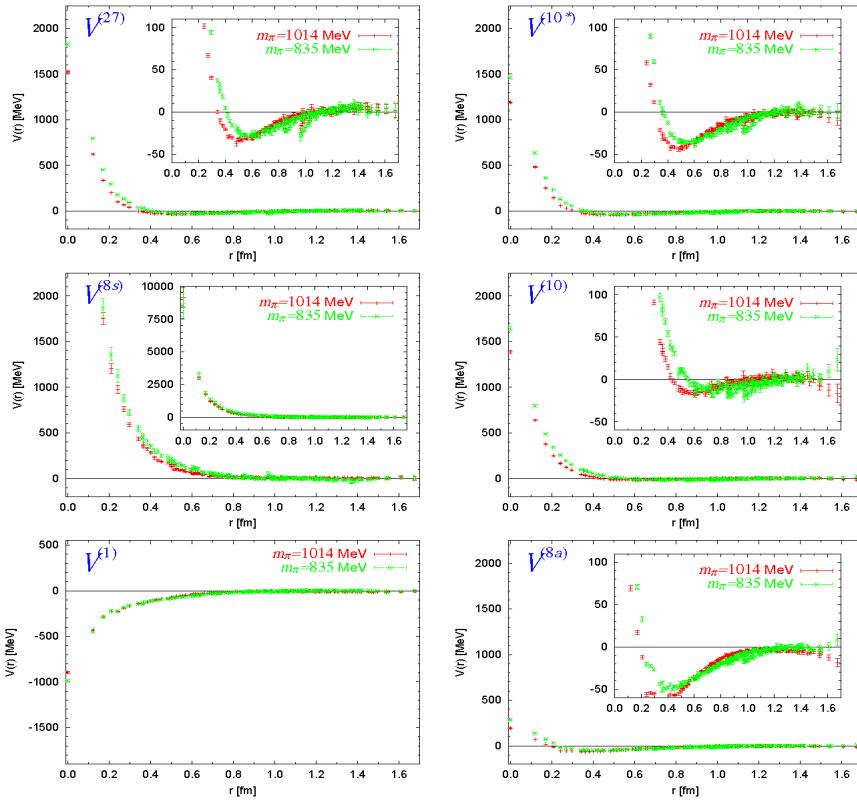

Fig. 2. The six independent BB potentials for S-wave in the flavor SU(3) limit, extracted from the lattice QCD simulation at $m_\pi = 1014$ MeV (red bars) and $m_\pi = 835$ MeV (green crosses).

T. Inoue et al.
(HAL QCD collaboration)

S-waves(l=1) :Repulsive()
P-waves: Attractive

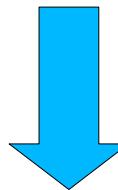

Extension to S=-3 and -4 BB Interactions

We model the BB interactions in the whole range

Short-range part by LQCD

Long-(medium-) range part by OBE

We can determine the S=-3,-4 BB interactions
without any additional parameters.

Predictions in S=-3 and -4 sectors

Scattering Lengths in $1S0$ and $3S1$ states with $S=-3,-4$ BB interactions

Scattering lengths(a) and effective ranges(r) (fm)

	EFT(LO)*	nsc97f	fss2	Z01X

Qualitatively,
Similar properties
are predicted

A: attractive
R: repulsive
(w : weakly)
B: bound state

*Haidenbauer and Meissner, PLB684(2010)275

S-wave $\Xi\Xi$ phase shifts

1S0 state attractive {27} (same with NN 1S0 {27})
BE=2.56 ~ 7.28MeV EFT(LO) (Haidenbauer and Meissner)
BE=4.44MeV our model(Z01X)

3S1 state repulsive {10} (not same with deuteron: {10*})

Summary

We proposed **a new version of BB potential model**

Long-range part : OBE

Short-range part : LQCD

Flavor-SU(3) symmetry

Our new version of BB potential reproduces reasonably

Repulsive $\Sigma N(l=3/2, 3S1)$, $\Sigma N(l=1/2, 1S0)$

Attractive $\Sigma N(l=3/2, 1S0)$, $\Sigma N(l=1/2, 3S1)$

Attractive $\Lambda\Lambda(l=0, 1S0)$

Attractive $U_\Xi(SNM) = -7\text{MeV}$ (Attractive P-wave ΞN contributions)

and predicts $S=-3,-4$ BB interactions:

3 s-wave bound states

$\Sigma\Xi(l=3/2, 1S0)$ (BE=1.5MeV)

$\Sigma\Xi(l=3/2, 3S1)$ (BE=2.8MeV)

$\Xi\Xi(l=1, 1S0)$ (BE=4.4MeV)

Repulsive $\Xi\Xi(l=0, 3S1)$ interaction

EFT(LO) and OBE models have similar properties
