

Understanding the nature of heavy pentaquarks and searching for them in pion-induced reactions

Xiao-Hai Liu

Tokyo Institute of Technology

For MENU2016, Kyoto University, 2016.07.27

Outline

- **Early study in 1960s**
- **Triangle singularity (TS) mechanism**
- **TS mechanism and the heavy pentaquark “Pc”**
- **Searching for the heavy pentaquark in $\pi p \rightarrow \pi J/\psi p$**
- **Summary**

Triangle Singularity Mechanism

Early study in 1960s

➤ **Connections between kinematic singularities of the S-matrix elements and resonance-like peaks: e.g. Peierls mechanism**

R.F.Peierls, PRL6,641(1961);

R.C.Hwa, PhysRev130,2580(1963);

C.Goebel,PRL13,143(1964);

P.Landshoff&S.Treiman Phys.Rev.127,649(1962);

.....

➤ **Some disadvantages:**

✓ **Few experiments to search for the effects;**

✓ **Low statistics;**

✓ **For the elastic scattering process, the effect of the triangle diagram is nothing more than a multiplication of the singularity from the tree diagram by a phase factor, according to the so-called Schmid theorem**

C.Schmid,Phys.Rev.154,1363(1967);

I. J. R. Aitchison & C. Kacser, Phys.Rev.173,1700(1968); A.V. Anisovich, PLB345,321(1995)

Cusp effect

Resulted from charge-exchange rescattering $\pi^+\pi^- \rightarrow \pi^0\pi^0$
and the pion mass difference

Budini & Fonda, 1961;
Cabibbo, 2004;

Branching ratio

$$K^+ \rightarrow \pi^+\pi^-\pi^+ ((5.59 \pm 0.04)\%)$$

much larger than

$$K^+ \rightarrow \pi^0\pi^0\pi^+ ((1.761 \pm 0.022)\%)$$

NA48/2, PLB633,173
 6×10^7 events

Triangle Singularity Mechanism

$$P^2 = s_1, (p_b + p_c)^2 = s_2$$

$$p_a^2 = s_3$$

$$\Gamma_3(s_1, s_2, s_3) = \frac{-1}{16\pi^2} \int_0^1 \int_0^1 \int_0^1 da_1 da_2 da_3 \frac{\delta(1 - a_1 - a_2 - a_3)}{D - i\epsilon}$$

$$D = \sum_{i,j=1}^3 a_i a_j Y_{ij}, \quad Y_{ij} = \frac{1}{2} [m_i^2 + m_j^2 - (q_i - q_j)^2]$$

✓ Singularity in the complex space

Necessary conditions (Landau Equation)

$$D = 0,$$

$$\text{either } a_j = 0 \text{ or } \frac{\partial D}{\partial a_j} = 0.$$

Leading singularity

Landau, Nucl.Phys.13,181(1959)

Triangle Singularity Mechanism

$$P^2 = s_1, (p_b + p_c)^2 = s_2$$

$$p_a^2 = s_3$$

✓ Singularity in the complex space

The position of the singularity is obtained by solving

$$\det[Y_{ij}] = 0$$

Normal Threshold

$s_1, s_3, m_{1,2,3}$ fixed

$$s_2^\pm = (m_1 + m_3)^2 + \frac{1}{2m_2^2} [(m_1^2 + m_2^2 - s_3)(s_1 - m_2^2 - m_3^2) - 4m_2^2 m_1 m_3$$

$$\pm \lambda^{1/2}(s_1, m_2^2, m_3^2) \lambda^{1/2}(s_3, m_1^2, m_2^2)], \quad \lambda(x, y, z) \equiv (x - y - z)^2 - 4yz$$

Anomalous Threshold

$$s_1^\pm = (m_2 + m_3)^2 + \frac{1}{2m_1^2} [(m_1^2 + m_2^2 - s_3)(s_2 - m_1^2 - m_3^2) - 4m_1^2 m_2 m_3$$

$$\pm \lambda^{1/2}(s_2, m_1^2, m_3^2) \lambda^{1/2}(s_3, m_1^2, m_2^2)].$$

$s_2, s_3, m_{1,2,3}$ fixed

Triangle Singularity Mechanism

Single dispersion relation

$$\Gamma_3(s_1, s_2, s_3) = \frac{1}{\pi} \int_{(m_1+m_3)^2}^{\infty} \frac{ds'_2}{s'_2 - s_2 - i\epsilon} \sigma(s_1, s'_2, s_3)$$

$$\sigma(s_1, s_2, s_3) = \sigma_+ - \sigma_-$$

$$\sigma_{\pm}(s_1, s_2, s_3) = \frac{-1}{16\pi\lambda^{1/2}(s_1, s_2, s_3)} \log[-s_2(s_1 + s_3 - s_2 + m_1^2 + m_3^2 - 2m_2^2) - (s_1 - s_3)(m_1^2 - m_3^2) \pm \lambda^{1/2}(s_1, s_2, s_3)\lambda^{1/2}(s_2, m_1^2, m_3^2)].$$

Work in the kinematical region

$$s_1 \leq (m_2 + m_3)^2, \quad s_3 \leq (m_2 - m_1)^2 \quad 0 < s_2 < (m_1 + m_3)^2$$

By analytic continuation, it can be extended into the over threshold region **Fronsdal&Norton, J.Math.Phys.5,100(1964)**

$$s_1 \geq (m_2 + m_3)^2, \quad (m_1 + m_3)^2 \leq s_2 \leq (\sqrt{s_1} - \sqrt{s_3})^2, \quad 0 \leq \sqrt{s_3} \leq m_2 - m_1$$

Branch points of the log function s_2^{\pm}

Triangle Singularity Mechanism

Locations of s_2^\pm in the s_2' -plane can be determined by

$$s_2^\pm(s_1 + i\epsilon) = s_2(s_1) + i\epsilon \frac{\partial s_2^\pm}{\partial s_1}$$

$$A^\pm : s_1 = (m_2 + m_3)^2, \quad B^\pm : s_1 = (m_2 + m_3)^2 + \frac{m_3}{m_1} [(m_2 - m_1)^2 - s_3] \quad = s_{1C}$$

$$A^- : s_2^- = (m_1 + m_3)^2 + \frac{m_3}{m_2} [(m_2 - m_1)^2 - s_3] - i\epsilon \quad = s_{2C}$$

$$B^- : s_2^- = (m_1 + m_3)^2 \quad = s_{2N}$$

s_2^- and P will pinch the integral contour

This pinch singularity is the triangle singularity (TS)

Triangle Singularity Mechanism

Locations of s_2^\pm in the s_2 '-plane can be determined by

$$s_2^\pm(s_1 + i\epsilon) = s_2(s_1) + i\epsilon \frac{\partial s_2^\pm}{\partial s_1}$$

singularity of the integrand $s_2 + i\epsilon$

Trajectory of the branch

“The kinematic conditions for the existence of singularities on the physical boundary are equivalent to the condition that the relevant Feynman diagram be interpretable as a picture of an energy and momentum-conserving process occurring in space-time, with all internal particles real, on the mass shell and moving forward in time.”

Coleman&Norton, Nuovo Cimento 38,5018 (1965)

Fronsdal&Norton, J.Math.Phys.5, 100(1964)

.....

TS Kinematic Region

Normal threshold and critical point

$$s_{1N} = (m_2 + m_3)^2, \quad s_{1C} = (m_2 + m_3)^2 + \frac{m_3}{m_1} [(m_2 - m_1)^2 - s_3],$$

$$s_{2N} = (m_1 + m_3)^2, \quad s_{2C} = (m_1 + m_3)^2 + \frac{m_3}{m_2} [(m_2 - m_1)^2 - s_3],$$

$$\Delta_{s_1} = \sqrt{s_1^-} - \sqrt{s_{1N}},$$

$$\Delta_{s_2} = \sqrt{s_2^-} - \sqrt{s_{2N}}.$$

When $s_2 = s_{2N}$

$$\Delta_{s_1}^{\max} = \sqrt{s_{1C}} - \sqrt{s_{1N}} \approx \frac{m_3}{2m_1(m_2 + m_3)} [(m_2 - m_1)^2 - s_3],$$

When $s_1 = s_{1N}$

$$\Delta_{s_2}^{\max} = \sqrt{s_{2C}} - \sqrt{s_{2N}} \approx \frac{m_3}{2m_2(m_1 + m_3)} [(m_2 - m_1)^2 - s_3].$$

Discrepancy between anomalous and normal threshold

How to amplify the discrepancy between normal and anomalous threshold?

Liu, Oka, Zhao, PLB753,297 (2016)

arXiv:1507.01674

TS Kinematic Region

Normal threshold and critical point

$$s_{1N} = (m_2 + m_3)^2, \quad s_{1C} = (m_2 + m_3)^2 + \frac{m_3}{m_1} [(m_2 - m_1)^2 - s_3],$$

$$s_{2N} = (m_1 + m_3)^2, \quad s_{2C} = (m_1 + m_3)^2 + \frac{m_3}{m_2} [(m_2 - m_1)^2 - s_3],$$

$$\Delta_{s_1} = \sqrt{s_1^-} - \sqrt{s_{1N}},$$

$$\Delta_{s_2} = \sqrt{s_2^-} - \sqrt{s_{2N}}.$$

Discrepancy between anomalous and normal threshold

$$\Delta_{s_1}^{\max} = \sqrt{s_{1C}} - \sqrt{s_{1N}} \approx \frac{m_3}{2m_1(m_2 + m_3)} [(m_2 - m_1)^2 - s_3],$$

$$\Delta_{s_2}^{\max} = \sqrt{s_{2C}} - \sqrt{s_{2N}} \approx \frac{m_3}{2m_2(m_1 + m_3)} [(m_2 - m_1)^2 - s_3].$$

Largest discrepancy

How to amplify the discrepancy between normal and anomalous threshold?

**Liu, Oka, Zhao, PLB753,297 (2016)
arXiv:1507.01674**

If the discrepancy is larger, maybe it could be used to distinguish the kinematic singularities from genuine particles.

Searching for the heavy pentaquark in $\pi p \rightarrow \pi J/\psi p$

TS mechanism is a highly process-dependent mechanism.
Different kinds of processes are required to check it.

$$\Delta_{s_1}^{\max} = \sqrt{s_{1C}} - \sqrt{s_{1N}} \approx \frac{m_3}{2m_1(m_2 + m_3)} [(m_2 - m_1)^2 - s_3],$$

$$\Delta_{s_2}^{\max} = \sqrt{s_{2C}} - \sqrt{s_{2N}} \approx \frac{m_3}{2m_2(m_1 + m_3)} [(m_2 - m_1)^2 - s_3].$$

Requirements:

- The quantity $[(m_2 - m_1)^2 - s_3]$ should be larger (phase space should be larger);
- Particle q_2 should not be too broad;
- Balance between the phase space and width.

Width Effect of the Intermediate State

Adopt the Breit-Wigner type propagator in the triangle loop integral

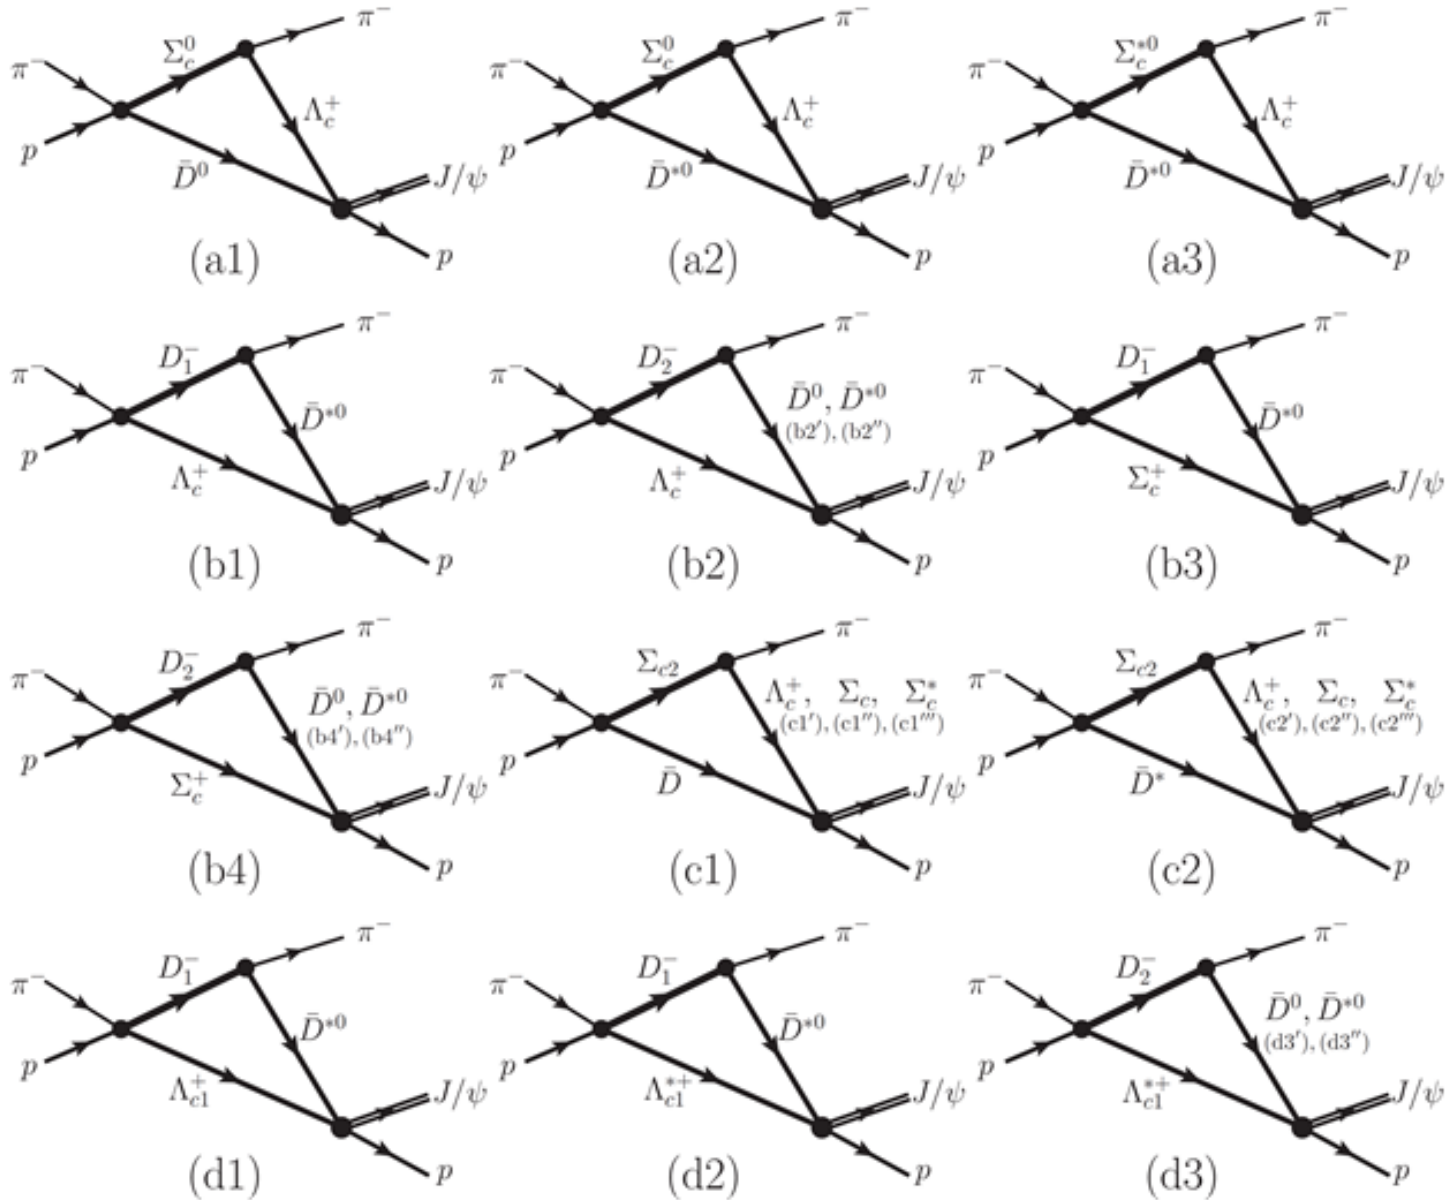

$$G_{\mathcal{D}}^{(0)} = \frac{i}{q_{\mathcal{D}}^2 - m_{\mathcal{D}}^2 + i m_{\mathcal{D}} \Gamma_{\mathcal{D}}},$$

$$G_{Y_c}^{(\frac{1}{2})} = \frac{i m_{Y_c} (1 + \psi)}{q_{Y_c}^2 - m_{Y_c}^2 + i m_{Y_c} \Gamma_{Y_c}},$$

Rarita-Schwinger wave functions for higher spin particles

BW type propagator will remove the TS from the physical boundary by a small distance, if the corresponding decay width is smaller. I.J.R. Aitchison & C. Kacser, PR133, B1239 (1964)

$\pi p \rightarrow \pi J/\psi p$ via the open-charm loops

$\pi p \rightarrow \pi J/\psi$ via the open-charm loops

- I) (a1)-(a3): Both \bar{D} and Y_c are S -wave states,
- II) (b1)-(b4): \bar{D} is a P -wave state and Y_c is an S -wave state,
- III) (c1)-(c2): \bar{D} is an S -wave state and Y_c is a P -wave state,
- IV) (d1)-(d3): Both \bar{D} and Y_c are P -wave states.

TS Kinematic Region

Formalism

The model is built in the framework of heavy hadron chiral perturbation theory (HHChPT)

Charmed Meson Superfield:

$$\begin{aligned}H_{1a} &= \frac{1 + \not{v}}{2} [D_{a\mu}^* \gamma^\mu - D_a \gamma_5], \\H_{2a} &= [\bar{D}_{a\mu}^* \gamma^\mu + \bar{D}_a \gamma_5] \frac{1 - \not{v}}{2}, \\T_{1a}^\mu &= \frac{1 + \not{v}}{2} \left\{ D_{2a}^{\mu\nu} \gamma_\nu - \sqrt{\frac{3}{2}} D_{1a\nu} \right. \\&\quad \left. \times \gamma_5 \left[g^{\mu\nu} - \frac{1}{3} \gamma^\nu (\gamma^\mu - v^\mu) \right] \right\}, \\T_{2a}^\mu &= \left\{ \bar{D}_{2a}^{\mu\nu} \gamma_\nu + \sqrt{\frac{3}{2}} \bar{D}_{1a\nu} \right. \\&\quad \left. \times \gamma_5 \left[g^{\mu\nu} - \frac{1}{3} \gamma^\nu (\gamma^\mu - v^\mu) \right] \right\} \frac{1 - \not{v}}{2}, \\ \bar{H}_{1a,2a} &= \gamma^0 H_{1a,2a}^\dagger \gamma^0, \quad \bar{T}_{1a,2a} = \gamma^0 T_{1a,2a}^\dagger \gamma^0,\end{aligned}$$

Formalism

Charmed Baryon Superfield:

$$\mathcal{T}_i = \frac{1}{2} \epsilon_{ijk} \frac{1 + \psi}{2} (B_{\bar{3}})_{jk},$$

$$\mathcal{R}_\mu = \frac{1}{\sqrt{3}} (\gamma_\mu + v_\mu) \gamma_5 \frac{1 + \psi}{2} \Lambda_{c1}^+ + \frac{1 + \psi}{2} \Lambda_{c1}^{*+},$$

$$\mathcal{S}_\mu^{ij} = \frac{1 + \psi}{2} B_{6\mu}^{*ij} + \frac{1}{\sqrt{3}} (\gamma_\mu + v_\mu) \gamma_5 \frac{1 + \psi}{2} B_6^{ij},$$

$$\mathcal{X}_{\mu\nu}^{ij} = \frac{1}{\sqrt{10}} [(\gamma_\mu + v_\mu) \gamma_5 g_\nu^\alpha + (\gamma_\nu + v_\nu) \gamma_5 g_\mu^\alpha] X_\alpha^{ij},$$

$$(B_{\bar{3}})_{ij} = \begin{pmatrix} 0 & \Lambda_c^+ & \Xi_c^+ \\ -\Lambda_c^+ & 0 & \Xi_c^0 \\ -\Xi_c^+ & -\Xi_c^0 & 0 \end{pmatrix}_{ij} \quad (B_6)_{ij} = \begin{pmatrix} \Sigma_c^{++} & \frac{1}{\sqrt{2}} \Sigma_c^+ & \frac{1}{\sqrt{2}} \Xi_c'^+ \\ \frac{1}{\sqrt{2}} \Sigma_c^+ & \Sigma_c^0 & \frac{1}{\sqrt{2}} \Xi_c'^0 \\ \frac{1}{\sqrt{2}} \Xi_c'^+ & \frac{1}{\sqrt{2}} \Xi_c'^0 & \Omega_c^0 \end{pmatrix}_{ij}$$

$$(X)_{ij} = \begin{pmatrix} \Sigma_{c2}^{++} & \frac{1}{\sqrt{2}} \Sigma_{c2}^+ & \frac{1}{\sqrt{2}} \Xi_{c2}'^+ \\ \frac{1}{\sqrt{2}} \Sigma_{c2}^+ & \Sigma_{c2}^0 & \frac{1}{\sqrt{2}} \Xi_{c2}'^0 \\ \frac{1}{\sqrt{2}} \Xi_{c2}'^+ & \frac{1}{\sqrt{2}} \Xi_{c2}'^0 & \Omega_{c2}^0 \end{pmatrix}_{ij}$$

Formalism

Effective Lagrangian, combining the chiral symmetry and the heavy quark spin symmetry

$$\mathcal{L}_{\text{meson}} = i \frac{h'}{\Lambda_\chi} \text{Tr} [\bar{H}_{2a} T_{2b}^\mu \gamma^\nu \gamma_5 (D_\mu \mathcal{A}_\nu + D_\nu \mathcal{A}_\mu)_{ba}] + \text{h.c.},$$

$$\begin{aligned} \mathcal{L}_{\text{baryon}} = & -\sqrt{3} g_2 \text{Tr} [\bar{B}_3 \mathcal{A}^\mu \mathcal{S}_\mu + \bar{\mathcal{S}}_\mu \mathcal{A}^\mu B_3] \\ & + i h_{10} \epsilon_{ijk} \bar{T}_i (D_\mu \mathcal{A}_\nu + D_\nu \mathcal{A}_\mu)_{jl} \mathcal{X}_{kl}^{\mu\nu} \\ & + h_{11} \epsilon_{\mu\nu\sigma\lambda} v^\lambda \text{Tr} [\bar{\mathcal{S}}^\mu (D^\nu \mathcal{A}_\alpha + D_\alpha \mathcal{A}^\nu) \mathcal{X}^{\alpha\sigma}], \end{aligned}$$

Cho, PRD50,3295 (1994); PLB285,145(1992); Prijol&Yan,

$$\mathcal{A}_\mu = \frac{i}{2} (\xi^\dagger \partial_\mu \xi - \xi \partial_\mu \xi^\dagger) \text{PRD56,5483(1997); Cheng\&Chua, PRD75,014006}$$

$$\xi = e^{i\mathcal{M}/f_\pi}, \quad \mathcal{M} = \begin{pmatrix} \frac{1}{\sqrt{2}}\pi^0 + \frac{1}{\sqrt{6}}\eta & \pi^+ & K^+ \\ \pi^- & -\frac{1}{\sqrt{2}}\pi^0 + \frac{1}{\sqrt{6}}\eta & K^0 \\ K^- & \bar{K}^0 & -\sqrt{\frac{2}{3}}\eta \end{pmatrix}$$

$$D_\mu = \partial_\mu + \mathcal{V}_\mu, \quad \mathcal{V}_\mu = \frac{1}{2} (\xi^\dagger \partial_\mu \xi + \xi \partial_\mu \xi^\dagger)$$

Formalism

Coupling constants can be determined by the corresponding decay widths

$$h' = 0.43,$$

$$g_2 = 0.565,$$

$$|h_{10}| = 0.85.$$

By means of the quark model

$$|h_{11}| = \sqrt{2}|h_{10}|$$

Prijol&Yan, PRD56,5483(1997)

D-wave decay modes (advantage for the TS mechanism)

$$\bar{D}_1 \rightarrow \bar{D}^* \pi, \quad \bar{D}_2 \rightarrow \bar{D}^{(*)} \pi \quad \Sigma_{c2} \rightarrow \Lambda_c \pi / \Sigma_c^{(*)} \pi$$

Formalism

Effective Lagrangian for $\bar{D}Y_c \rightarrow J/\psi p$

$$\mathcal{L}_{\text{ct}} = g_{\Lambda_c} \bar{N} H_2 \bar{J} \mathcal{T}_3 + g_{\Sigma_c} \bar{N} \gamma_\mu \gamma_5 H_2 \bar{J} \mathcal{S}^\mu + i g_{\Lambda_{c1}} \partial_\mu \bar{N} H_2 \bar{J} \mathcal{R}^\mu,$$

$$J = \frac{1 + \psi}{2} [\psi (nS)^\mu \gamma_\mu - \eta_c (nS) \gamma_5] \frac{1 - \psi}{2}$$

$$\bar{J} = \gamma^0 J \gamma^0.$$

For these short range interactions, from the dimensional analysis, it is expected that the couplings g_{Λ_c} (g_{Σ_c}) and $g_{\Lambda_{c1}}$ are of the order of magnitude of m_D^{-2} and m_D^{-3} respectively, where m_D is the mass of the D meson. Notice that in HHChPT, the heavy field H_2 (J) in Eq. (26) will contain a factor $\sqrt{M_{H_2}}$ ($\sqrt{M_J}$) for normalization. In addition, we will estimate the scattering amplitudes in the static limit, which means the four velocity is set to $v = (1, 0, 0, 0)$.

Formalism

Effective Lagrangian for $\pi^- p \rightarrow \bar{D} Y_c$, with the fewest derivatives

$$\mathcal{L}_{a1} = \frac{g_{a1}}{2m_D} \mathbb{D} \tau \cdot \pi \tau \cdot \bar{\Sigma}_c N,$$

$$\mathcal{L}_{a2} = \frac{g_{a2}}{2m_D} \mathbb{D}_\mu^* \tau \cdot \pi \tau \cdot \bar{\Sigma}_c \gamma_5 \gamma^\mu N,$$

$$\mathcal{L}_{a3} = \frac{g_{a3}}{2m_D} \mathbb{D}_\mu^* \tau \cdot \pi \tau \cdot \bar{\Sigma}_c^{*\mu} N,$$

$$\mathcal{L}_{b1} = \frac{ig_{b1}}{\sqrt{2}m_D^2} \mathbb{D}_1^\mu \tau \cdot \partial_\mu \pi \bar{\Lambda}_c N,$$

$$\mathcal{L}_{b2} = \frac{ig_{b2}}{\sqrt{2}m_D^2} \mathbb{D}_2^{\mu\nu} \tau \cdot \partial_\mu \pi \bar{\Lambda}_c \gamma_5 \gamma_\nu N,$$

$$\mathcal{L}_{b3} = \frac{ig_{b3}}{2m_D^2} \mathbb{D}_1^\mu \tau \cdot \partial_\mu \pi \tau \cdot \bar{\Sigma}_c N,$$

$$\mathcal{L}_{b4} = \frac{ig_{b4}}{2m_D^2} \mathbb{D}_2^{\mu\nu} \tau \cdot \partial_\mu \pi \tau \cdot \bar{\Sigma}_c \gamma_5 \gamma_\nu N,$$

$$\mathcal{L}_{c1} = \frac{ig_{c1}}{2m_D^2} \mathbb{D} \tau \cdot \partial_\mu \pi \tau \cdot \bar{\Sigma}_{c2}^\mu N,$$

$$\mathcal{L}_{c2} = \frac{ig_{c2}}{2m_D^2} \mathbb{D}_\mu^* \tau \cdot \partial_\nu \pi \tau \cdot \bar{\Sigma}_{c2}^\mu \gamma_5 \gamma^\nu N,$$

$$\mathcal{L}_{d1} = \frac{g_{d1}}{\sqrt{2}m_D} \mathbb{D}_1^\mu \tau \cdot \pi \bar{\Lambda}_{c1} \gamma_5 \gamma_\mu N,$$

$$\mathcal{L}_{d2} = \frac{g_{d2}}{\sqrt{2}m_D} \mathbb{D}_1^\mu \tau \cdot \pi \bar{\Lambda}_{c1\mu}^* N,$$

$$\mathcal{L}_{d3} = \frac{g_{d3}}{\sqrt{2}m_D} \mathbb{D}_2^{\mu\nu} \tau \cdot \pi \bar{\Lambda}_{c1\mu}^* \gamma_5 \gamma_\nu N,$$

$$\mathbb{D} = (D^0, D^+)$$

Open-charm Production

Experimental and theoretical constraints on the open-charm productions in πN collisions:

$$\sigma(\pi^- p \rightarrow D^{*-} \Lambda_c^+) \text{ and } \sigma(\pi^- p \rightarrow D^{*-} \Sigma_c^+)$$

upper limit at 13 GeV is about **7 nb** BNL, PRL55, 154(1985)

Effective Lagrangian method and Regge approach: **at the order of 1 nb** S.H. Kim et al, PRD92, 094001 (2015); arXiv: 1405.3445

Generalized parton picture: **at the order of nb**
S. Kofler et al, PRD91, 054027 (2015)

Our assumptions:

$\sigma(\pi^- p \rightarrow \bar{D} Y_c)$ is **1 nb at 20 GeV pion-beam energy**

Open-charm Production

Coupling constants according to the assumptions

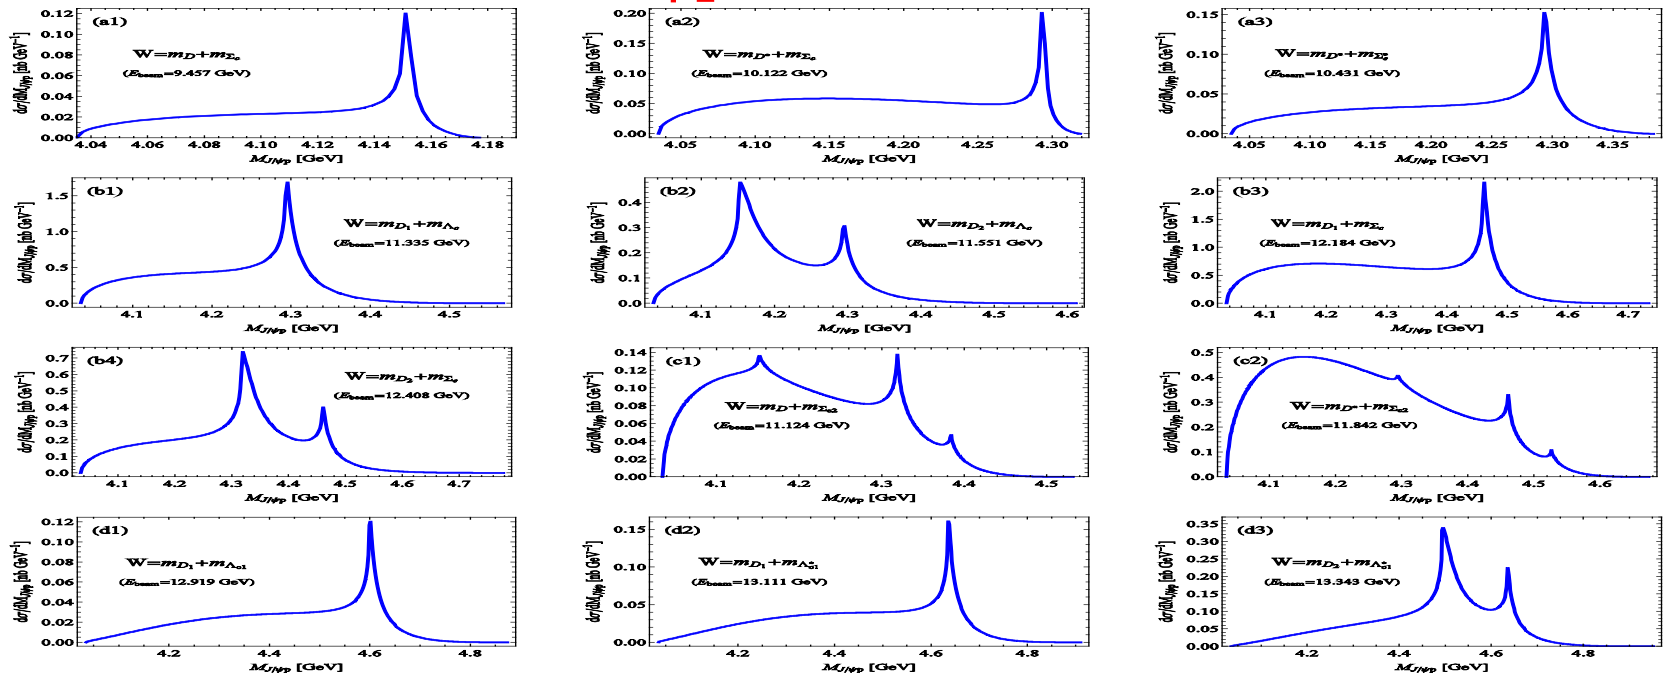

$\sigma(\pi^- p \rightarrow \bar{D}Y_c)$ is 1 nb at 20 GeV pion-beam energy

Numerical Results: J/ψ Invariant Mass Distribution

Numerical Results: J/ψ Invariant Mass Distribution

Summary

- **Kinematic singularities (TS) of the rescattering amplitude will behave themselves as peaks in the invariant mass distribution, which may imply that non-resonance interpretations for some resonance-like structures is possible.**
- **Being different from the genuine resonances, the TS mechanism is a highly process-dependent mechanism, and very sensitive to the kinematic configurations.**
- **The forthcoming J-PARC pion-induced experiment may offer us a good opportunity to check different kinematic or dynamic mechanisms and clarify the ambiguities, with its high luminosity.**

A scenic sunset over a body of water, likely Lake Kawaguchi, with Mount Fuji in the background. The sky is filled with soft, colorful clouds in shades of orange, yellow, and pink. In the foreground, a dark pier extends into the water, where several people are silhouetted against the bright light of the setting sun. The water reflects the colors of the sky, creating a shimmering effect. The overall atmosphere is peaceful and serene.

Thanks!

Amplitude in HQET

The weak amplitude $\langle \Lambda_{c1}^{(*)} \bar{D}_{sJ}^{(*)} | H_{\text{eff}} | \Lambda_b \rangle$ can be factorized into

$$\langle \Lambda_{c1}^{(*)} | (V - A)_\mu | \Lambda_b \rangle \langle \bar{D}_{sJ}^{(*)} | (V - A)^\mu | 0 \rangle$$

At the leading order

$$\langle \Lambda_{c1}^{(*)} | (V - A)_\mu | \Lambda_b \rangle = \xi(\omega) v_\alpha \bar{\mathcal{R}}_{v'}^\alpha (V - A)_\mu \Lambda_{bv}$$

$$\mathcal{R}_v^\alpha = \frac{1}{\sqrt{3}} (\gamma^\alpha + v^\alpha) \gamma_5 \frac{1 + \not{v}}{2} \Lambda_{c1} + \frac{1 - \not{v}}{2} \Lambda_{c1}^{*\alpha}$$

For the contact interaction

$$\mathcal{L}_{\text{ct}} = ig_{\Lambda_{c1}} \partial_\mu \bar{N} H_2 \bar{J} \mathcal{R}^\mu$$

$\Lambda_{c1}^{(*)} \bar{D}_{sJ}^{(*)}$ loops

suppressed by heavy
quark symmetry

competitive

$\chi_{cJ} \Lambda^*$ loops

OZI suppressed

Amplitude in HQET

Mass of $D_{sJ}^{(*)}$ **2.86 GeV**

2.95 GeV

The broad $D_{s1}(2860)$ is accepted as a D-wave charmed-strange meson

$\Gamma(D_{s1} \rightarrow D \kappa) / \Gamma(D_{s1} \rightarrow D^* \kappa)$ is approximately 2.
