

Open charm contributions to the E1 transitions of $\psi(3686)$ and $\psi(3770) \rightarrow \gamma\chi_{cJ}$

Friday, 29 July 2016 18:20 (30 minutes)

The E1 transitions of $\psi(3686)$ and $\psi(3770) \rightarrow \gamma\chi_{cJ}$ are investigated in a non-relativistic effective field theory (NREFT) where the open charm effects are included systematically as the leading corrections. It also allows a self-consistent inclusion of the S-D mixing in the same framework. It shows that the open charm contributions are essential for understanding the significant deviations of the non-relativistic leading order calculations from the experimental data.

Presenter: CAO, Zheng (Institute of High Energy Physics, Chinese Academy of Sciences)
