

Baryon Spectroscopy with Electromagnetic Probes

Friday, 29 July 2016 11:40 (40 minutes)

Knowing the structure of excited baryons is an important gateway to probing non-perturbative QCD. The CLAS system at Jefferson Lab has delivered a wealth of precise photo- and electro-production information about light-quark baryon structure. Examples from photoproduction of strange baryons that lead to insight about the non-strange N spectrum will be discussed. Examples from electroproduction of various N states that lead to insight about their internal structure will be discussed.

Presenter: SCHUMACHER, Reinhard (Carnegie Mellon University)

Session Classification: Plenary
