

EOS study in nuclear physics

Juzo Zenihiro

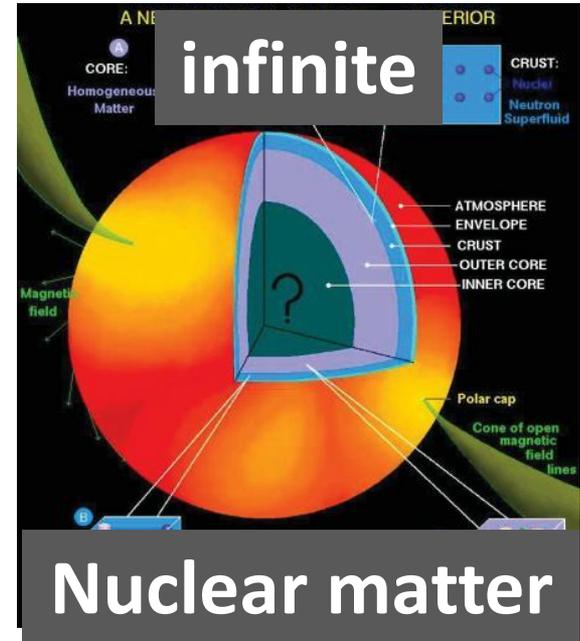

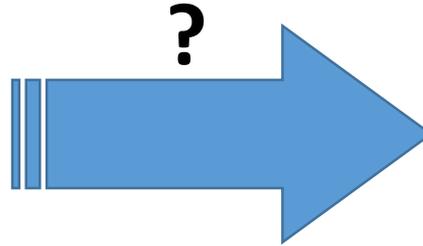

前回のおさらい: EOSのこれまでとこれから

- **ここ5年**のEOS研究: $E(\rho, \delta) = E(\rho, 0) + S(\rho)\delta^2$ これだけ。
 - 少なからずいまだ核構造モデルの不定性に縛られている。
 - しかし近年では**スキンや密度分布、非圧縮率(incompressibility)、電気双極分極率(dipole polarizability)**を、モデル依存を出来るだけ排除して決める方法論が開発されてきている。
 - Sum ruleが活躍
 - EOSの特にSymmetry energyに対してある程度の制限を課すことができつつある。
 - 舞台は不安定核へ
- **これから5年**は? 完璧な J, L, K_{sym} を目指して。
 - 最早大雑把な制限ではなく、モデルを構築するための確固たるインプットとしての**系統的**なsurveyが必須。(荷電半径、結合エネルギーなどに続く。)。
 - アイソスピン→スキン、非圧縮率、電気双極分極率、質量 → ESPRI, CAT, R3,
 - 密度→重イオン衝突による、 $2\rho_0$ での π^+/π^- ratio、核子間相互作用の密度依存→ SPIRIT, HI elastic
 - RCNP並の精密測定を不安定核で目指す!
 - 100(!)-132SnやCa、Niを含む中重核を一網打尽にする。
- **10年(以上)**を見据えると? EOSってそもそも。。。
 - 本当のところNeutron Star Matter ($\delta \rightarrow 1, \rho > 2\rho_0$)をどのようにして観るのか?
 - 核物質の新たな側面を見るには新しい軸でもって見る。アイソスピン、密度に加えて。
 - p と n 以外の構成要素の寄与(クラスター自由度?)、 d, t, a, π, \dots などの核物質中での確率分布(原子核版パートン分布): **Cluster, Parton**
 - 有限温度核物質のEOS(基底状態でない): **Temperature**
 - 中性子星物質とは何なのか? (not中性子物質?、ハイペロン含むハドロン相、クォーク相、EMC効果?): **Phase shift**
 - マグネターも新しい原子核物理のモデルケースになりうるか? 核物質中で高磁場を生み出すダイナミクス。原子核のダイナモ理論。高スピンの核物質に及ぼす寄与: **Magnetic moment? High Spin? (classical nuclear matter?), Spin Susceptibility?**
 - といった新しい自由度を含むEOSの構築。

Nucleus

Nuclear structure

- ρ_p & ρ_n , neutron skin
- ISGMR
- Dipole polarizability
- ...

Basic input \rightarrow EOS

$$: E(\rho, \delta) = E(\rho, 0) + S(\rho)\delta^2$$

$\delta=0$: Symmetric matter

$\delta=1$: Neutron matter

Nuclear matter EOS with isospin asymmetry δ

- EOS of nuclear matter $\mathcal{E}(\rho, \delta)$: the energy per nucleon

$$\mathcal{E}(\rho, \delta) = \mathcal{E}(\rho, 0) + \mathcal{S}(\rho)\delta^2 + O(\delta^4)$$

- EOS of symmetric nuclear matter $\mathcal{E}(\rho, 0)$:

$$\mathcal{E}(\rho, 0) = \mathcal{E}(\rho_{\text{sat}}, 0) + \frac{K_0}{2}\varepsilon^2 + O(\varepsilon^3)$$

$$\rightarrow \mathcal{E}(\rho_{\text{sat}}, 0) \sim -16 \text{ MeV},$$

$$K_0 \sim 240 \text{ MeV}$$

- The symmetry energy $\mathcal{S}(\rho)$:

$$\mathcal{S}(\rho) = \mathcal{S}(\rho_{\text{sat}}) + L\delta + \frac{K_{\text{sym}}}{2}\varepsilon^2 + O(\varepsilon^3)$$

\rightarrow Still less certain !

$$\delta = \frac{\rho_n - \rho_p}{\rho_n + \rho_p}, \quad \varepsilon = \frac{\rho - \rho_{\text{sat}}}{3\rho_{\text{sat}}}$$

EOS study: Symmetry energy exp.

ESPRI : ρ_p, ρ_n & **Skin** thickness : L , **saturation**

(p, p) elastic for stable & unstable nuclei

$^{204-208}\text{Pb}$, $^{116-124}\text{Sn}$, ^{90}Zr , $^{40-48}\text{Ca}$ (RCNP)

^{132}Sn , $^{66,70}\text{Ni}$, ^{16}C (RIBF, GSI)

CAT : **Incompressibility** of nuclear matter: K_{sym}

GMR by (d, d') or (a, a') around 0 degree

^{132}Sn (RIBF)

SAMURAI-TPC (SPiRIT) : EOS at $2\rho_0$

π^+/π^- ratio by HI collision (Sn isotope?) (RIBF)

A-A HI elastic scattering : EOS at $2\rho_0$

Theory : H. Sakuragi, T. Furumoto

Planned ; $^{12}\text{C}-^{12}\text{C}$ at 100, 200, 300 (RCNP, RIBF)

(p, p') at 0 degree : **Dipole Polarizability** : L

proton inelastic scattering (^{208}Pb , ^{120}Sn , ^{90}Zr) (RCNP)

PREX-II, CREX at J-lab : neutron radius & skin thickness : L

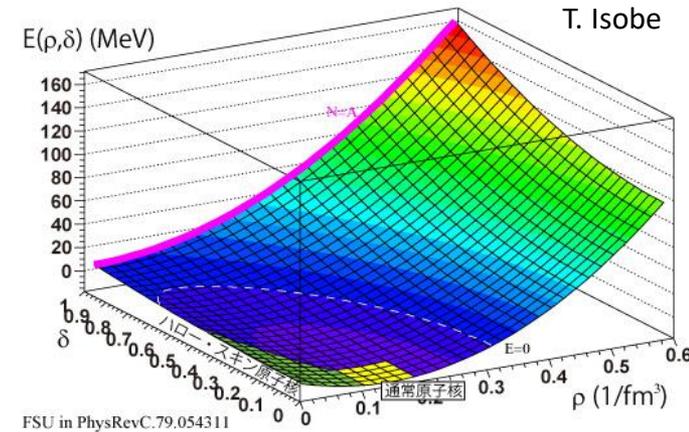

parity-violating electron elastic scattering

2015/10/27

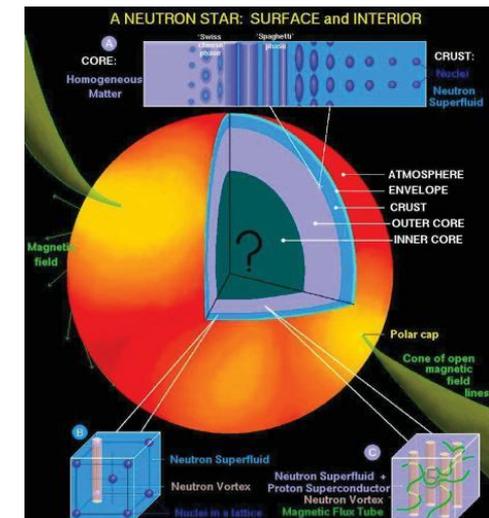

Stable nuclei : ^{208}Pb , ^{48}Ca

By S. Terashima

Double magic nucleus : ^{132}Sn

Next target of ESPRI : $^{50,52}\text{Ca}$

Summary of ESPRI

- Neutron skins of double magic stable and unstable nuclei (flagship)
 - 40,48Ca, 132Sn, 208Pb
- Next step : systematic survey of long isotope, isotone, isobar chains
 - 50,52Ca, 50Ti, 52Cr
- Future : challenging experiment for 100Sn, 54Ca, 78Ni
 - New techniques are necessary.
