# Assessing the foundation of the Trojan Horse Method 

C.A. Bertulani

CB, Hussein, Typel, Phys. Lett. B 776, 217 (2018)

## Transfer reactions

## Transfer reactions

## Consider the reaction

## Transfer reactions

Consider the reaction
B
$\mathrm{A}+\underbrace{(\mathrm{x}+\mathrm{b})} \rightarrow \mathrm{b}+\mathrm{c}+\mathrm{C}$

bound (a)

Need to solve (neglect anti-symmetrization)

$$
\begin{aligned}
& {\left[\mathrm{E}-\left(\mathrm{K}_{\mathrm{x}}+\mathrm{K}_{\mathrm{b}}+\mathrm{K}_{\mathrm{A}}+\mathrm{V}_{\mathrm{xb}}+\mathrm{U}_{\mathrm{xA}}+\mathrm{U}_{\mathrm{bA}}\right)\right]\left|\Psi_{3 \mathrm{~B}}^{(+)} \Phi_{\mathrm{A}} \phi_{\mathrm{a}}\right\rangle=0} \\
& \left|\Psi_{3 \mathrm{~B}}^{(+)}\right\rangle=\text {full 3-body x+b+A wavefunction }
\end{aligned}
$$

## Inclusive Non-Elastic Breakup Cross Section (INEB)

$$
\frac{\mathrm{d}^{2} \sigma_{\mathrm{b}}^{\mathrm{INEB},(\mathrm{D})}}{\mathrm{dE}_{\mathrm{b}} \mathrm{~d} \Omega_{\mathrm{b}}}=\rho_{\mathrm{b}}\left(\mathrm{E}_{\mathrm{b}}\right) \frac{\mathrm{k}_{\mathrm{x}}}{\mathrm{E}_{\mathrm{x}}}\left\langle\rho_{\mathrm{x}}^{(+\operatorname{IAV}}\right| \mathrm{W}_{\mathrm{x}}^{\mathrm{D}}\left|\rho_{\mathrm{x}}^{(+) \mathrm{IAV}}\right\rangle
$$

All interactions coupling the ground to direct inelastic states

$$
\begin{gathered}
\mathrm{W}_{\mathrm{x}}^{\mathrm{D}}=-\pi \sum_{\mathrm{f}} \frac{\mathrm{~d} \mathbf{k}_{\mathrm{f}}}{(2 \pi)^{3}} \mathrm{~V}_{(0, \mathrm{f})}\left|\chi_{\mathrm{f}}^{(-)}\left(\mathbf{k}_{\mathrm{f}}\right)\right\rangle\left\langle\chi_{\mathrm{f}}^{(-)}\left(\mathbf{k}_{\mathrm{f}}\right)\right| \mathrm{V}_{(0, \mathrm{f})} \delta\left(\mathrm{E}_{\mathrm{x}}-\mathrm{E}_{\mathrm{f}}\right) \\
\mathrm{V}_{(0, \mathrm{f})}=\mathrm{P}_{\mathrm{x}}^{(0)} \mathrm{VP}_{\mathrm{x}}^{(\mathrm{D})}
\end{gathered}
$$

Inclusive Non-Elastic Breakup Cross Section (INEB)

## Inclusive Non-Elastic Breakup Cross Section (INEB)

$$
\left.\frac{\mathrm{d}^{2} \sigma_{\mathrm{b}}^{\mathrm{INEB},(\mathrm{D})}}{\mathrm{dE}_{\mathrm{b}} \mathrm{~d} \Omega_{\mathrm{b}}}=-\pi \rho_{\mathrm{b}}\left(\mathrm{E}_{\mathrm{b}}\right) \frac{\mathrm{k}_{\mathrm{x}}}{\mathrm{E}_{\mathrm{x}}} \sum_{\mathrm{f}} \frac{\mathrm{~d} \mathbf{k}_{\mathrm{f}}}{(2 \pi)^{3}} \delta\left(\mathrm{E}_{\mathrm{x}}-\mathrm{E}_{\mathrm{f}}\right)\left|\left\langle\chi_{\mathrm{f}}^{(-)}\left(\mathbf{k}_{\mathrm{f}}\right)\right| \mathrm{V}_{(0, \mathrm{f})}\right| \rho_{\mathrm{x}}^{(+) \mathrm{IAV}}\right\rangle\left.\right|^{2}
$$

## Inclusive Non-Elastic Breakup Cross Section (INEB)

$$
\left.\frac{\mathrm{d}^{2} \sigma_{\mathrm{b}}^{\mathrm{INEB},(\mathrm{D})}}{\mathrm{dE}_{\mathrm{b}} \mathrm{~d} \Omega_{\mathrm{b}}}=-\pi \rho_{\mathrm{b}}\left(\mathrm{E}_{\mathrm{b}}\right) \frac{\mathrm{k}_{\mathrm{x}}}{\mathrm{E}_{\mathrm{x}}} \sum_{\mathrm{f}} \frac{\mathrm{~d}_{\mathrm{f}}}{(2 \pi)^{3}} \delta\left(\mathrm{E}_{\mathrm{x}}-\mathrm{E}_{\mathrm{f}}\right)\left|\left\langle\chi_{\mathrm{f}}^{(-)}\left(\mathbf{k}_{\mathrm{f}}\right)\right| \mathrm{V}_{(0, \mathrm{f})}\right| \rho_{\mathrm{x}}^{(+) I A \mathrm{~V}}\right\rangle\left.\right|^{2}
$$

Consider a particular $\mathrm{x}+\mathrm{A}$ channel, i.e., $\mathrm{y}+\mathrm{B}$

$$
\frac{d^{2} \sigma_{b}^{\mathrm{INEB},(\mathrm{D})}}{\mathrm{dE}_{\mathrm{b}} \mathrm{~d} \Omega_{\mathrm{b}} \mathrm{dE}} \mathrm{y} \text { d } \Omega_{\mathrm{y}} \quad=-\pi \rho_{\mathrm{b}}\left(\mathrm{E}_{\mathrm{b}}\right) \rho_{\mathrm{y}}\left(\mathrm{E}_{\mathrm{y}}\right) \frac{\mathrm{k}_{\mathrm{x}}}{\mathrm{E}_{\mathrm{x}}}
$$

$$
\times \mid\left\langle\chi_{\mathrm{y}}^{(-)}\left(\mathbf{k}_{\mathrm{y}}\right)\right| \mathrm{V}_{(\mathrm{x}, \mathrm{y})} \mathrm{G}_{\uparrow}^{(+)}|\underbrace{\left|\chi_{\mathrm{b}}^{(-)}\right| \mathrm{V}_{\mathrm{xb}}\left|\phi_{\mathrm{a}} \chi_{\mathrm{a}}^{(+)}\right\rangle}_{\uparrow}|^{2}
$$

transition to $y$ channel propagation of $x$ elastic breakup

## The Trojan Horse formula

## The Trojan Horse formula

Assume factorization $\quad \chi_{\mathrm{a}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}, \mathbf{r}_{\mathrm{x}}\right)=\chi_{\mathrm{b}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right) \chi_{\mathrm{x}}^{(+)}\left(\mathbf{r}_{\mathrm{x}}\right)$

## The Trojan Horse formula

Assume factorization $\quad \chi_{\mathrm{a}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}, \mathbf{r}_{\mathrm{x}}\right)=\chi_{\mathrm{b}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right) \chi_{\mathrm{x}}^{(+)}\left(\mathbf{r}_{\mathrm{x}}\right)$
and define $\quad \hat{S}_{\mathrm{b}}\left(\mathbf{r}_{\mathrm{x}}\right)=\left\langle\chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(-)}\left(\mathbf{r}_{\mathrm{b}}\right) \phi_{\mathrm{a}}\left(\mathbf{r}_{\mathrm{x}}, \mathbf{r}_{\mathrm{b}}\right) \mid \chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right)\right\rangle$

## The Trojan Horse formula

Assume factorization $\quad \chi_{\mathrm{a}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}, \mathbf{r}_{\mathrm{x}}\right)=\chi_{\mathrm{b}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right) \chi_{\mathrm{x}}^{(+)}\left(\mathbf{r}_{\mathrm{x}}\right)$
and define $\quad \hat{\mathrm{S}}_{\mathrm{b}}\left(\mathbf{r}_{\mathrm{x}}\right)=\left\langle\chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(-)}\left(\mathbf{r}_{\mathrm{b}}\right) \phi_{\mathrm{a}}\left(\mathbf{r}_{\mathrm{x}}, \mathbf{r}_{\mathrm{b}}\right) \mid \chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right)\right\rangle$
$\left.\Rightarrow \frac{\mathrm{d}^{2} \sigma_{\mathrm{b}}^{\mathrm{INEB},(\mathrm{D})}}{\mathrm{dE} \mathrm{E}_{\mathrm{b}} \mathrm{d} \Omega_{\mathrm{b}}}=\rho_{\mathrm{b}}\left(\mathrm{E}_{\mathrm{b}}\right) \frac{\mathrm{k}_{\mathrm{x}}}{\mathrm{E}_{\mathrm{x}}}\left|\left\langle\chi_{\mathrm{y}}^{(-)}\right| \mathrm{V}_{(\mathrm{x}, \mathrm{y})} \hat{S}_{\mathrm{b}}\left(\mathbf{r}_{\mathrm{x}}\right)\right| \chi_{\mathrm{x}}^{(+)}\right\rangle\left.\right|^{2}$

## The Trojan Horse formula

Assume factorization $\quad \chi_{\mathrm{a}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}, \mathbf{r}_{\mathrm{x}}\right)=\chi_{\mathrm{b}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right) \chi_{\mathrm{x}}^{(+)}\left(\mathbf{r}_{\mathrm{x}}\right)$
and define $\quad \hat{\mathrm{S}}_{\mathrm{b}}\left(\mathbf{r}_{\mathrm{x}}\right)=\left\langle\chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(-)}\left(\mathbf{r}_{\mathrm{b}}\right) \phi_{\mathrm{a}}\left(\mathbf{r}_{\mathrm{x}}, \mathbf{r}_{\mathrm{b}}\right) \mid \chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right)\right\rangle$

Approximation: maximum survival

$$
\hat{\mathrm{S}}_{\mathrm{b}}\left(\mathbf{r}_{\mathrm{x}}\right) \approx \phi_{\mathrm{a}}\left(\mathbf{r}_{\mathrm{b}}\right)
$$ probability for b

## The Trojan Horse formula

Assume factorization $\quad \chi_{\mathrm{a}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}, \mathbf{r}_{\mathrm{x}}\right)=\chi_{\mathrm{b}}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right) \chi_{\mathrm{x}}^{(+)}\left(\mathbf{r}_{\mathrm{x}}\right)$
and define $\quad \hat{\mathrm{S}}_{\mathrm{b}}\left(\mathbf{r}_{\mathrm{x}}\right)=\left\langle\chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(-)}\left(\mathbf{r}_{\mathrm{b}}\right) \phi_{\mathrm{a}}\left(\mathbf{r}_{\mathrm{x}}, \mathbf{r}_{\mathrm{b}}\right) \mid \chi_{\left(\mathrm{b}, \mathbf{k}_{\mathrm{b}}\right)}^{(+)}\left(\mathbf{r}_{\mathrm{b}}\right)\right\rangle$
$\left.\Rightarrow \frac{d^{2} \sigma_{b}^{\text {INEB },(D)}}{d E_{b} d \Omega_{b}}=\rho_{b}\left(E_{b}\right) \frac{k_{x}}{E_{x}}\left|\left\langle\chi_{y}^{(-)}\right| V_{(x, y)} \hat{S}_{b}\left(\mathbf{r}_{\mathrm{x}}\right)\right| \chi_{\mathrm{x}}^{(+)}\right\rangle\left.\right|^{2}$

Approximation: maximum survival

$$
\hat{\mathrm{S}}_{\mathrm{b}}\left(\mathbf{r}_{\mathrm{x}}\right) \approx \phi_{\mathrm{a}}\left(\mathbf{r}_{\mathrm{b}}\right)
$$ probability for b

$$
\frac{\mathrm{d}^{2} \sigma_{\mathrm{b}}^{\text {INEB,(D) }}}{\mathrm{dE}_{\mathrm{b}} \mathrm{~d} \Omega_{\mathrm{b}}}=\frac{\mathrm{d}^{2} \sigma_{\mathrm{b}}^{(\mathrm{THM})}}{\mathrm{dE}_{\mathrm{b}} \mathrm{~d} \Omega_{\mathrm{b}}}=\mathrm{K}_{(\mathrm{THM})}\left|\phi\left(\mathbf{k}_{\mathrm{b}}\right)\right|^{2} \sigma_{(\mathrm{x}+\mathrm{A} \rightarrow \mathrm{y}+\mathrm{B})}
$$

## Conclusions

## Conclusions

- The inclusive breakup formalism contains all information about the two-body clustered projectile reacting with a target.

## Conclusions

- The inclusive breakup formalism contains all information about the two-body clustered projectile reacting with a target.
- The Trojan Horse quasi-free cross section for the $x+A$ subsystem can be obtained under approximations:

## Conclusions

- The inclusive breakup formalism contains all information about the two-body clustered projectile reacting with a target.
- The Trojan Horse quasi-free cross section for the $x+A$ subsystem can be obtained under approximations:
- No antisymmetrization

## Conclusions

- The inclusive breakup formalism contains all information about the two-body clustered projectile reacting with a target.
- The Trojan Horse quasi-free cross section for the $x+A$ subsystem can be obtained under approximations:
- No antisymmetrization
- Weak influence of spectator $b$ on $x+A$

## Conclusions

- The inclusive breakup formalism contains all information about the two-body clustered projectile reacting with a target.
- The Trojan Horse quasi-free cross section for the $x+A$ subsystem can be obtained under approximations:
- No antisymmetrization
- Weak influence of spectator $b$ on $x+A$
- Factorization of 3-body wavefunctions

## Conclusions

- The inclusive breakup formalism contains all information about the two-body clustered projectile reacting with a target.
- The Trojan Horse quasi-free cross section for the $x+A$ subsystem can be obtained under approximations:
- No antisymmetrization
- Weak influence of spectator $b$ on $x+A$
- Factorization of 3-body wavefunctions
- Compound nucleus formation only included as a statistical contribution to potentials and wavefunctions

## Conclusions

- The inclusive breakup formalism contains all information about the two-body clustered projectile reacting with a target.
- The Trojan Horse quasi-free cross section for the $x+A$ subsystem can be obtained under approximations:
- No antisymmetrization
- Weak influence of spectator $b$ on $x+A$
- Factorization of 3-body wavefunctions
- Compound nucleus formation only included as a statistical contribution to potentials and wavefunctions
- Peripherality, i.e., maximum survival probability of $b$

CB, Hussein, Typel, Phys. Lett. B 776, 217 (2018)
