

# Resonance Raman Signature of Intertube Excitons in Compositionally-Defined Carbon Nanotube Bundles

Wednesday, 11 July 2018 18:45 (15 minutes)

Electronic interactions in low-dimensional nanomaterial heterostructures can lead to novel optical responses arising from exciton delocalization over the constituent materials. Similar phenomena have been suggested to arise between closely interacting semiconducting carbon nanotubes of identical structure. Such behavior in carbon nanotubes has potential to generate new exciton physics, impact exciton transport mechanisms in nanotube networks, and place nanotubes as one-dimensional models for such behaviors in systems of higher dimensionality. Here we use resonance Raman spectroscopy to probe intertube interactions in (6,5) chirality-enriched bundles. Raman excitation profiles for the radial breathing mode and G-mode display a previously unobserved sharp resonance feature. We show the feature is evidence for creation of intertube excitons and is identified as a Fano resonance arising from the interaction between intratube and intertube excitons.<sup>1</sup> The universality of the model suggests that similar Raman excitation profile features may be observed for interlayer exciton resonances in 2D multilayered systems.

## Summary

**Primary authors:** Dr SIMPSON, Jeffrey R. (Towson University and National Institute of Standards & Technology); Dr ROSLYAK, Oleksiy (Fordham University); Dr DUQUE, Juan G. (Los Alamos National Lab); Dr HAROZ, Erik H. (Los Alamos National Lab); Dr CROCHET, Jared J. (Los Alamos National Lab); Dr TELG, Hagen (Los Alamos National Lab); Dr PIRYATINSKI, Andrei (Los Alamos National Lab); Dr HIGHT WALKER, Angela R. (National Institute of Standards & Technology); Dr DOORN, Stephen K. (Los Alamos National Lab)

**Presenter:** Dr SIMPSON, Jeffrey R. (Towson University and National Institute of Standards & Technology)

**Session Classification:** Poster Session
