

# Measurement of flavor asymmetry of light antiquarks in proton via Drell-Yan process at Fermilab SeaQuest

CNS + Radiation Lab Seminar  
2019/01/29 @ RIKEN

Kenichi Nakano

Tokyo Tech

# Outline

## 1. Research motivation

- Partonic structure of proton (nucleon)
- Experimental & theoretical understandings on  $\bar{d}(x)/\bar{u}(x)$
- Drell-Yan process for  $\bar{d}(x)/\bar{u}(x)$

## 2. Experimental setup

- Beam, target & spectrometer
- Data taking

## 3. Method & result of $\bar{d}(x)/\bar{u}(x)$ measurement

- Extraction method
- Preliminary result
- Recent progress

## 4. “E1039/SpinQuest”, the successor with polarized target

## 5. Summary

# 1. Research Motivation

# Internal Structure of Proton (Nucleon)

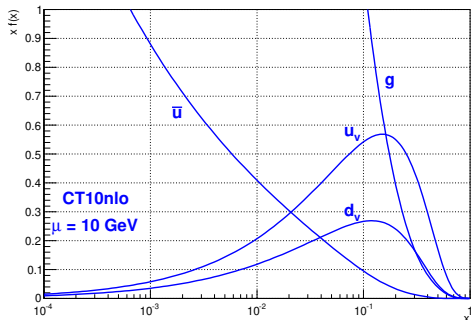

- Representations at various probing scale

- Proton structure at energy scale  $\mu \gtrsim 1 \text{ GeV}$  ( $\lambda \lesssim 1 \text{ fm}$ ) will be discussed
- Dynamical creation of **anti-quarks** from gluons ...  $g \rightarrow q\bar{q}$ 
  - Breakdown of proton momentum:  $q : \bar{q} : g \sim 45\% : 10\% : 45\%$  @  $\mu \sim 10 \text{ GeV}$

# Internal Structure of Proton (Nucleon)

- Parton distribution function:  $f(x, \mu^2)$

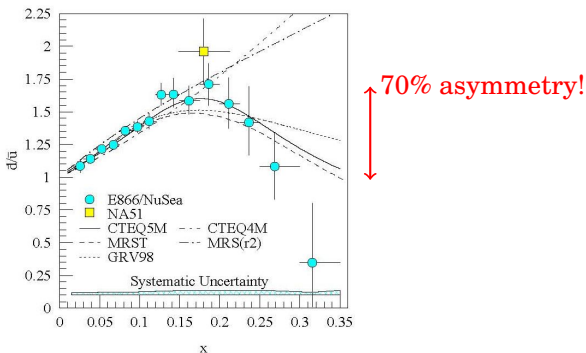

$$\text{Bjorken-}x \approx \frac{p_{\text{parton}}}{p_{\text{proton}}}$$

- The anti-quark distribution is flavor symmetric?
  - Strong force is independent of flavor
  - Splittings of  $g \rightarrow u\bar{u}$  &  $g \rightarrow d\bar{d}$  occur equally

# Anti-Quark Flavor Asymmetry: $\bar{d}/\bar{u}$

- CERN NMC ('90): deep inelastic muon scattering
  - Gottfried Sum:  $S_G = 0.2281(65) < 1/3$
  - $\int \bar{d}(x)dx > \int \bar{u}(x)dx$  ... discovery of flavor asymmetry of anti-quarks in proton
- Measurement of  $x$  dependence of  $\bar{u}(x)$  &  $\bar{d}(x)$ : Drell-Yan process
  - CERN NA51 ('94):  $\bar{d} > \bar{u}$  at  $x \sim 0.18$
  - FNAL E866/NuSea ('98):  $\bar{d}(x)/\bar{u}(x)$  for  $x \in (0.015, 0.35)$

# Theories of $\bar{d}/\bar{u}$ Asymmetry (1)

- Mass difference between  $u$  &  $d$  ( $\sim 2$  &  $5$  MeV) in  $g \rightarrow q\bar{q}$ 
  - Very small and even results in  $\bar{d} > \bar{u}$
- Pauli blocking ... *PRD15, 2590 (1977)*
  - $Prob(g \rightarrow u\bar{u}) < Prob(g \rightarrow d\bar{d})$  since  $p = uud$
  - Cannot explain the measured size ... *NPB149, 497 (1979)*
  - Even  $\bar{d} < \bar{u}$  via connected sea (at high  $x$ )? ... *PLB736, 411 (2014)*
- Chiral quark model ... *PRD59, 034024 (1999)*
  - Effective interaction between Goldstone boson ( $\pi$ ) & valence quark
  - $|q_{\text{constituent}}\rangle = (1 - \frac{3a}{2}) |q\rangle + \frac{3a}{2} |q\pi\rangle$

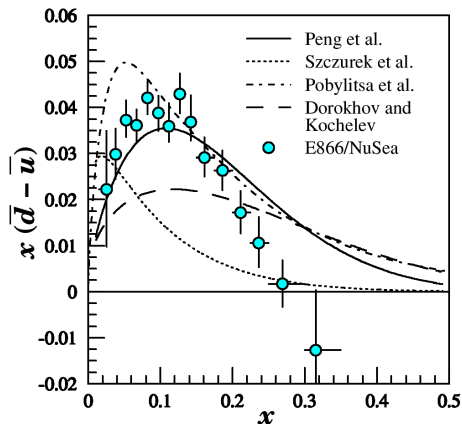

# Theories of $\bar{d}/\bar{u}$ Asymmetry (2)

- Statistical model ... *NPA941, 307 (2015)*
  - Based on the Fermi & Bose statistics
  - Predicts  $\bar{d}(x) - \bar{u}(x) = \Delta\bar{u}(x) - \Delta\bar{d}(x)$
- Meson cloud model ... *PRD58, 092004 (1998)*
  - $|p\rangle = (1 - a - b)|p_0\rangle + a|N\pi\rangle + b|\Delta\pi\rangle$
  - **More  $\bar{d}$**  in  $\pi^+$  as  $|n\pi^+\rangle$  etc.
  - **Less  $\bar{u}$**  in  $\pi^-$  as  $|\Delta^{++}\pi^-\rangle$  etc.
  - Predict non-zero  $L_{q,\bar{q}}$  like “meson tornado” (need  $L = 1$  of  $\pi$  to make  $J^P = 1/2^+$  of proton, as parity of  $\pi$  is  $J^P = 0^-$ )

# Comparison of Theories to Measurements

Meson cloud model: PRD58, 092004  
Chiral quark model: NPA596, 397  
Chiral quark model: PRD59, 034024  
Instanton model: PLB304, 167  
(Updated calculations exist)

- The  $x$  dependence of  $\bar{d}(x)/\bar{u}(x)$  is the key to develop/examine models
  - Sharp drop at  $x \sim 0.3$ . Even go down to  $\bar{d} < \bar{u}$ ?

# Flavor Asymmetry by Lattice QCD

- Direct calculation of PDF (not Mellin moment)
  - With large-momentum effective theory (LaMET)
  - ETM collaboration
  - LP<sup>3</sup> collaboration

PRL 121, 112001 (2018)

arXiv:1803.04393 (2018)

- $\bar{d}(x)/\bar{x}(x)$  is an attractive object on lattice as well

# Measurement of $\bar{d}(x)/\bar{u}(x)$ with Drell-Yan Process

- Drell-Yan process:  $p + p \rightarrow \gamma^* \rightarrow \mu^+ + \mu^-$

- Invariant mass:  $M^2 = x_{beam}x_{target}S$ ,

Rapidity:  $\exp Y = \sqrt{x_{beam}/x_{target}}$

- $x_{beam} = \frac{M}{\sqrt{s}}e^Y$ ,  $x_{target} = \frac{M}{\sqrt{s}}e^{-Y}$

- Cross section at LO:

$$\frac{d^2\sigma}{dx_{be}dx_{ta}} = \frac{4\pi\alpha^2}{9x_{be}x_{ta}s} \sum_{q=u,d} e_q^2 \{q_{be}(x_{be})\bar{q}_{ta}(x_{ta}) + \bar{q}_{be}(x_{be})q_{ta}(x_{ta})\}$$

- Only “ $q_{be}(x_{be})\bar{q}_{ta}(x_{ta})$ ” survives @ forward rapidity, i.e. quark in beam & **anti-quark** in target

- Ratio of cross sections with LH2 & LD2 targets

$$\frac{\sigma_{pd}(x_{ta})}{2\sigma_{pp}(x_{ta})} = \frac{\sigma_{pp}(x_{ta}) + \sigma_{pn}(x_{ta})}{2\sigma_{pp}(x_{ta})} \approx \frac{1}{2} \left( 1 + \frac{\bar{d}(x_{ta})}{\bar{u}(x_{ta})} \right)$$

- SeaQuest measures the  $x$  dependence of  $\bar{d}(x)/\bar{u}(x)$  particularly at high  $x$  ( $0.15 \lesssim x \lesssim 0.45$ )

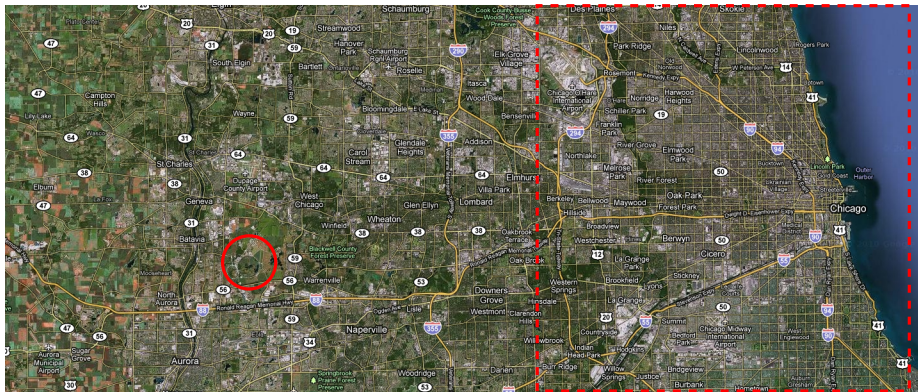

# Aim to Research Anti-Quark in Proton

1. Improve the accuracy of anti-quark PDFs
  - Proton is widely used in various research
  - $\bar{q}(x)$  is an input of hadron-reaction simulations (ex:  $u + \bar{d} \rightarrow W^+$ )
2. Investigate QCD effects on the proton structure
  - All anti-quarks are dynamically created by QCD
3. Examine hadron models based on QCD effective theory
  - Each model represents an aspect of hadrons
  - Can it well describe antiquarks also?

## 2. Experimental Setup

# Fermi National Accelerator Lab

# Fermilab Proton Beam

- Energy  $E = 120$  GeV  
( $\sqrt{s} = 15$  GeV)
- Duty cycle
  - 5 sec for E906
  - 55 sec for  $\nu$  exp.
- Bunch
  - Length: 1 nsec
  - Interval: 19 nsec (53 MHz)
  - $10^{13}$  protons in 5 sec in spot size

# FNAL-SeaQuest Collaboration

- Institutes

- Abilene Christian Univ.
- Argonne National Lab
- Fermi National Accelerator Lab
- KEK<sub>Jp</sub>
- Los Alamos National Lab
- Univ. of Michigan
- RIKEN<sub>Jp</sub>
- Tokyo Tech<sub>Jp</sub>
- Academia Sinica<sub>Tw</sub>
- Univ. of Colorado
- Univ. of Illinois
- Ling-Tung Univ.<sub>Tw</sub>
- Univ. of Maryland
- National Kaohsiung Normal Univ.
- Rutgers Univ.
- Yamagata Univ.<sub>Jp</sub>

# SeaQuest Hall — 2015-July-27

Measurement of flavor asymmetry of light antiquarks in proton via Drell-Yan process at Fermilab SeaQuest

# SeaQuest Targets

- $\text{LH}_2$ ,  $\text{LD}_2$ 
  - 50.8 cm  $\sim$  0.1 interaction lengths
- Iron, Carbon, Tungsten

# E906/SeaQuest Spectrometer

- Targets: LH<sub>2</sub>, LD<sub>2</sub>, C, Fe, W
- Focusing magnet (FMag) & Tracking magnet (KMag)
- Iron inside FMag, as hadron absorber & beam dump

- A typical Drell-Yan event (top view) ... mass = 6 GeV,  $\theta_{\mu^+} = 90^\circ$ ,  $\phi_{\mu^+} = 0^\circ$

- Detection of dimuons

- Station 1-3 : Tracking with drift chambers
- Station 4 : Particle identification with drift tube
- Momenta of detected muons are 40 GeV/c on average

# SeaQuest Data Taking

- Data-taking periods

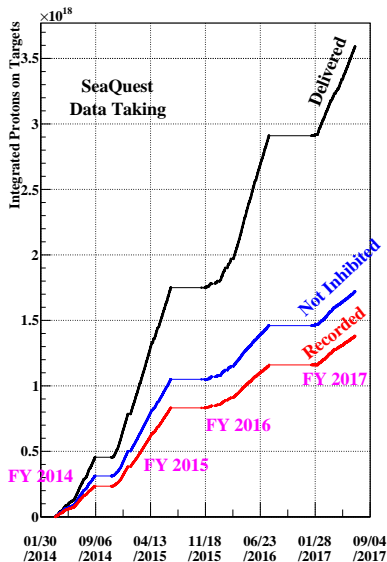

Year	Month	Event
2012	03-04	1st data taking (commissioning)
2013	11-	2nd data taking (10 months)
2014	11-	3rd data taking (8 months)
2015	10-	4th data taking (10 months)
2016	12-	5th data taking (7 months)

- Beam protons on targets

- $1.4 \times 10^{18}$  recorded
- $0.6 \times 10^{18}$  analyzed for preliminary  $\bar{d}/\bar{u}$

- Last data taken in FY2017

- Wider chamber acceptance at St. 1  
 $\implies$  40% more events at high  $x$  ( $\sim 0.4$ )
- Top+Top & Bottom+Bottom events (thanks to faster DAQ)  
 $\implies$  30% more events

### 3. Method & Result of $\bar{d}(x)/\bar{u}(x)$ Measurement

# Extraction of $\bar{d}(x)/\bar{u}(x)$ — Step 1

- Measure Drell-Yan events with two targets
  - LH2 & LD2 targets
  - Invariant mass  $> 4.2$  GeV
- Correct Drell-Yan yields for
  - Backgrounds
  - Reconstruction efficiency (due to detector hit rates)
- Normalize with relative luminosity
- Take the ratio of normalized yields

$$\frac{\sigma_{pd}(x_{ta})}{2\sigma_{pp}(x_{ta})} \approx \frac{1}{2} \left( 1 + \frac{\bar{d}(x_{ta})}{\bar{u}(x_{ta})} \right)$$

- Systematic errors cancel out between  $\sigma_{pd}$  &  $\sigma_{pp}$
- Direct observable in experiment

# Cross-Section Ratio: $\sigma_{pd}/2\sigma_{pp}$

- Preliminary result with  $\sim 70\%$  of FY 2014 & 2015 data

- Systematic errors
  - H contamination of LD2 target
  - Background subtraction
  - Tracking efficiency correction
- $\sigma_{pd}/2\sigma_{pp}$  always  $> 1$  in measured  $x$  range

## Extraction of $\bar{d}(x)/\bar{u}(x)$ — Step 2

- Derive  $\bar{d}(x)/\bar{u}(x)$  from  $\sigma_{pd}/2\sigma_{pp}$ 
  - This relation is not accurate at high  $x_{ta}$

$$\frac{\sigma_{pd}(x_{ta})}{2\sigma_{pp}(x_{ta})} \approx \frac{1}{2} \left( 1 + \frac{\bar{d}(x_{ta})}{\bar{u}(x_{ta})} \right)$$

because the assumption “ $x_{be} \gg x_{ta}$ ” breaks

- Iterative calculation from  $\bar{d}/\bar{u}$  to  $\sigma_{pd}/2\sigma_{pp}$
1. Have the measured  $\sigma_{pd}/2\sigma_{pp}$  ( $\equiv R_{meas}$ )
  2. Initialize  $\bar{d}(x)/\bar{u}(x) = 1$
  3. Calculate the cross-section ratio ( $\equiv R_{pred}$ ) **without assuming  $x_{be} \gg x_{ta}$** :

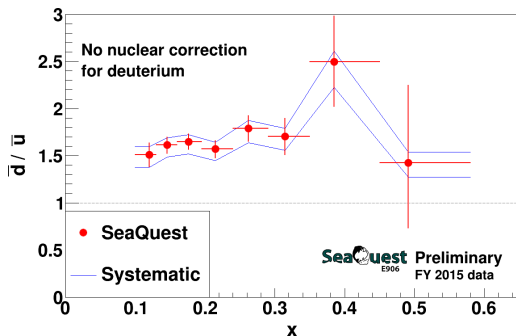

$$\sigma \propto \sum_{q=u,d} e_q^2 \{ q_{be}(x_{be}) \bar{q}_{ta}(x_{ta}) + \bar{q}_{be}(x_{be}) q_{ta}(x_{ta}) \}$$

- Use event-by-event measured kinematics ( $x_{be}$  &  $x_{ta}$ )
  - Take  $u(x)$ ,  $d(x)$  &  $\bar{u}(x) + \bar{d}(x)$  from CT10 PDF
4. Adjust  $\bar{d}(x)/\bar{u}(x)$  to reduce  $R_{pred} - R_{meas}$
  5. Go back to #3 until  $R_{pred} \approx R_{meas}$

# Anti-Quark Flavor Asymmetry: $\bar{d}/\bar{u}$

- Preliminary result

- Systematic errors
  - Errors of cross-section ratio
  - Errors of CT10 PDF
  - $\bar{d}/\bar{u}$  outside the measured  $x$  range
- $\bar{d}/\bar{u} > 1$  at high  $x$  also

# Anti-Quark Flavor Asymmetry: $\bar{d}/\bar{u}$

- Comparison with other measurements

- All agree at small  $x$
- $\bar{d}/\bar{u}$  at  $x \sim 0.3$  seems higher by SeaQuest  
... Physical reasons for this difference are being investigated

# Anti-Quark Flavor Asymmetry: $\bar{d}/\bar{u}$

- Comparison with PDF models

- The key region is definitely  $x \sim 0.3$

# Recent Progress in Analysis

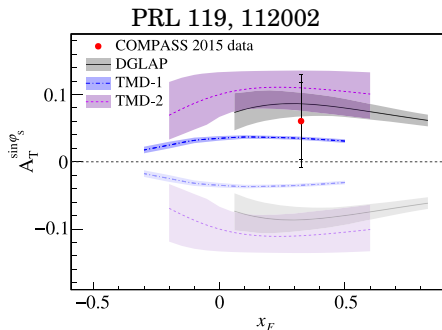

- Improvement in detector alignments
  - More parameters and finer time periods
- Increase of statistics
  - Detailed QAs and better calibrations  $\implies$  50% more analyzable events
  - Optimized dimuon selection for better S/N
- New correction method
  - Key effect = beam-intensity dependence
    - Efficiency of event reconstruction
    - Amount of random background
  - Past: “realistic” GMC simulation
  - New: intensity extrapolation
    - Cross-section ratio vs intensity
    - Extrapolation to “intensity = 0”

# **4. E1039/SpinQuest: Successor with Polarized Target**

# Sivers Distribution Function: $f_{1T}^\perp(x_{Bj}, k_T)$

- One of the eight transverse momentum dependent (TMD) PDFs
  - Correlation between **nucleon spin** ( $S$ ) & **quark transverse momentum** ( $k_T$ )
- Of **quarks**
  - Rather well constrained by measurements of SIDIS,  $p^\uparrow + p \rightarrow W^\pm/Z$  &  $\pi + p^\uparrow$  Drell-Yan
- Of **antiquarks**
  - Uncertain
  - Accessible by  $p + p^\uparrow$  Drell-Yan

# E1039/SpinQuest $\approx$ Polarized Target + SeaQuest

- Experimental design
  - SeaQuest spectrometer (almost as it is)
  - Polarized target
    - $\text{NH}_3$  &  $\text{ND}_3$  with  $L = 8$  cm,  $B = 5$  T
    - Called “Hall-C” target in past
    - Refurbished for transverse polarization
    - $dB/B < 10^{-4}$  &  $P \gtrsim 90\%$  achieved!!
- Status
  - Stage-2 approval was granted from Fermilab in May 2018
  - SeaQuest decommissioning is ongoing, particularly a reconfiguration of the radiation shielding
  - Data taking will start likely in 2019 for two years

During cool-down test in 2018

# Prospect of E1039 Measurement

- **Sivers** TMD PDF of **anti-quark**

- $\bar{u}$  &  $\bar{d}$  separately from  $p + \bar{p}$  &  $p + \bar{d}$

- **Observable: single-spin asymmetry  $A_N$**

$$A_N(\phi_S) \equiv \frac{\sigma^\uparrow(\phi_S) - \sigma^\downarrow(\phi_S)}{\sigma^\uparrow(\phi_S) + \sigma^\downarrow(\phi_S)} \sim \frac{f(x_B) \cdot f_{1T}^\perp(x_T)}{f(x_B) \cdot f(x_T)}$$

- Measurement accuracy  $\delta_{A_N} \sim 0.04$
- Compare with two calculations based on SIDIS data
  - Blue line takes into account the Collins-Soper-Sterman scale evolution

Phys. Rev. D88, 034016 (2013)

Eur. Phys. J. A39, 89 (2009)

## 5. Summary

- Internal structure of proton
  - Large flavor asymmetry  $\bar{d}(x)/\bar{u}(x)$  was observed
  - SeaQuest measures the  $x$  dependence of  $\bar{d}(x)/\bar{u}(x)$  with Drell-Yan process
  - Various aspects (like  $\bar{d}(x)$  vs  $\bar{u}(x)$ ,  $\Delta\bar{d}(x)$  vs  $\Delta\bar{u}(x)$  &  $L_{q,\bar{q}}$ ) are being studied together by experiments & theories
- SeaQuest experiment @ Fermilab
  - Recorded  $1.4 \times 10^{18}$  protons on targets by July 2017
  - Analyzed  $0.6 \times 10^{18}$  protons for preliminary  $\bar{d}/\bar{u}$
- Method & results of  $\bar{d}(x)/\bar{u}(x)$  measurement
  - Cross-section ratio  $\sigma_{p+d}/2\sigma_{p+p}$  was measured
  - $\bar{d}(x)/\bar{u}(x)$  was extracted with LO calculation
  - $\bar{d}(x)/\bar{u}(x) > 1$  was found up to  $x = 0.58$
  - Analyses toward final result with better statistics & systematics
- E1039/SpinQuest  $\approx$  polarized target + SeaQuest
  - Measure the antiquark Sivers function
  - Start this year for two-year data taking
