Overview

- Today, neutron star workshop
- Supernovae give birth to neutron stars

Today's theme

Long time simulation of supernovae is important

Keywords

- Supernova, neutrino, super-kamiokande

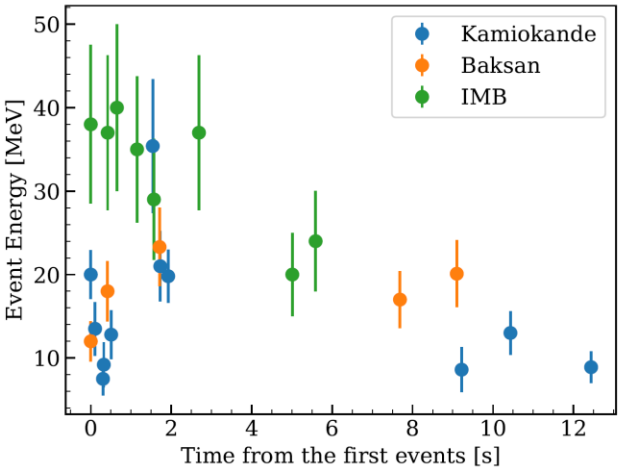
Supernova

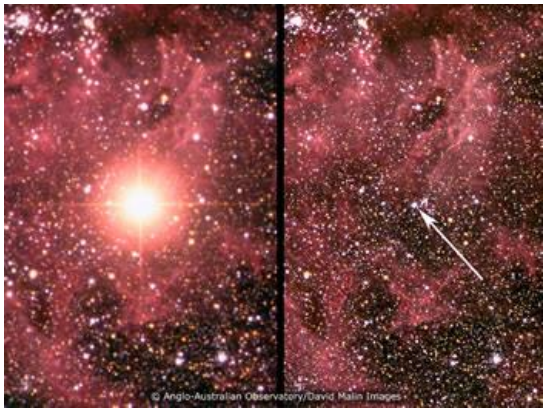
- 8 times heavier stars than the sun happen huge explosion
- Complicated phenomenon in which all the four forces of nature are related
  - ➢Not analytic calculation but heavy computation is needed
- Energy of 10^{53}erg is released as neutrino
  - ➢ Only one observation in 1987 (SN1987A)

SN1987A information

Distance:51.2 kpc
Number of events: Detector

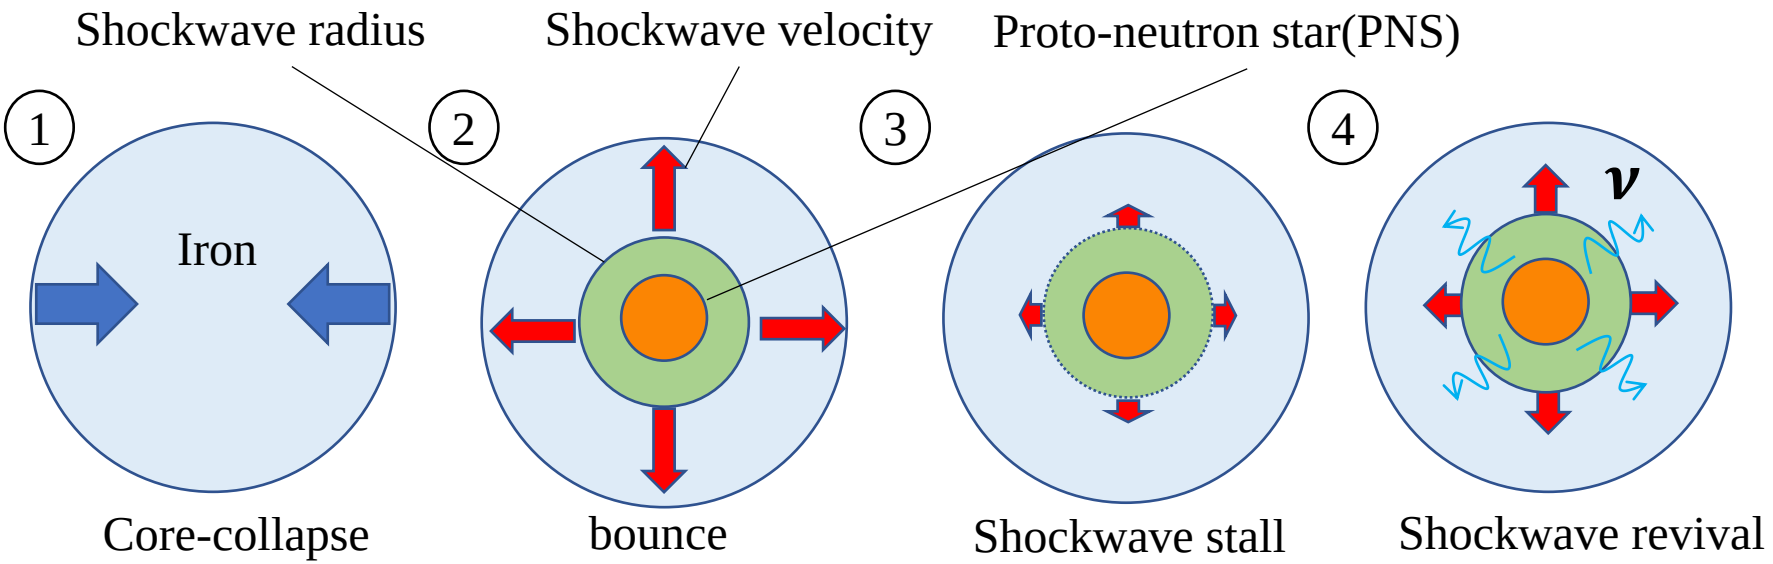
- 11: Kamiokande(2.14 kton)
- 8: IMB [2]
- 5: Baksan [3]

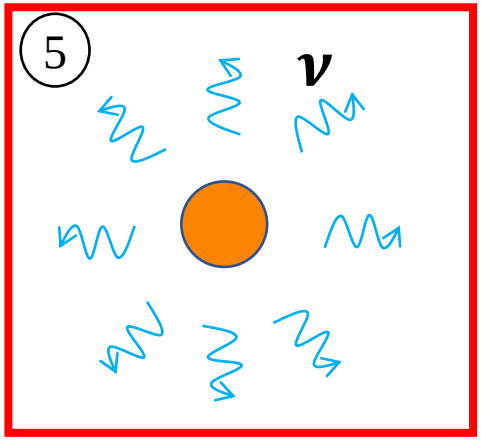




[1]Hirata et al. 1987
[2]Bionta et al. 1987
[3]Alekseev et al. 1987

Supernova evolution



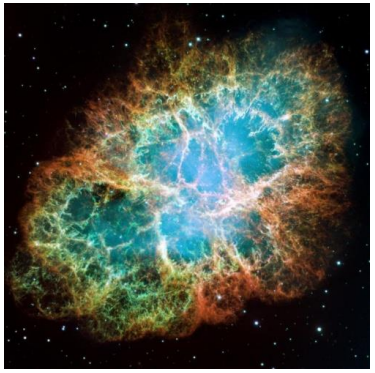


PNS cooling

About 1 sec.

Phase 5 continues more than 100 sec. and releases half of energy and more.

6



Optical observation

https://hubblesite.org/resource-gallery

Supernova evolution

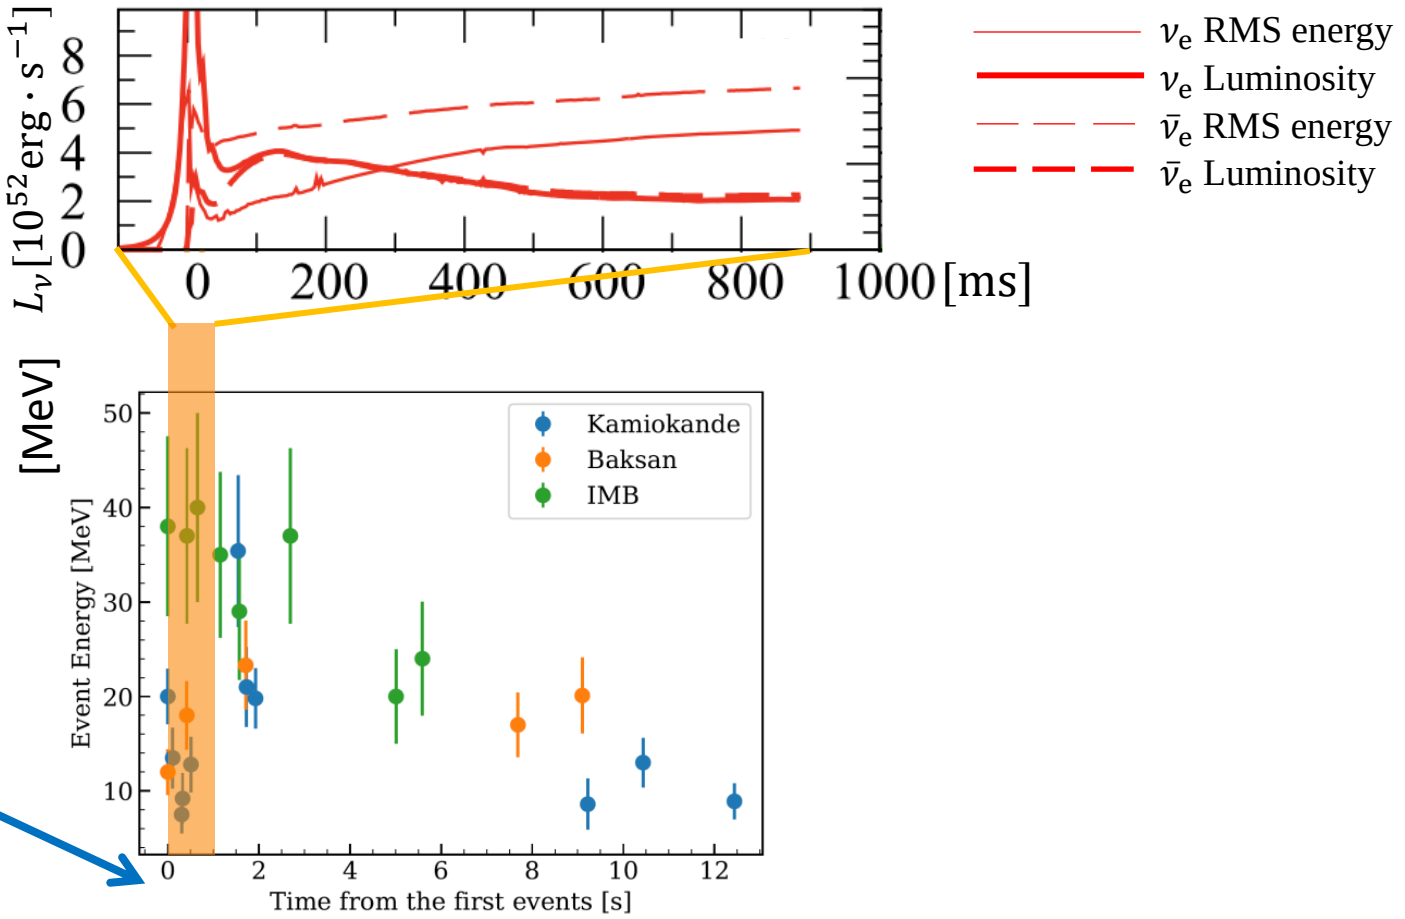
Supernova simulation problem

- Most simulations concentrates on early 1 sec.

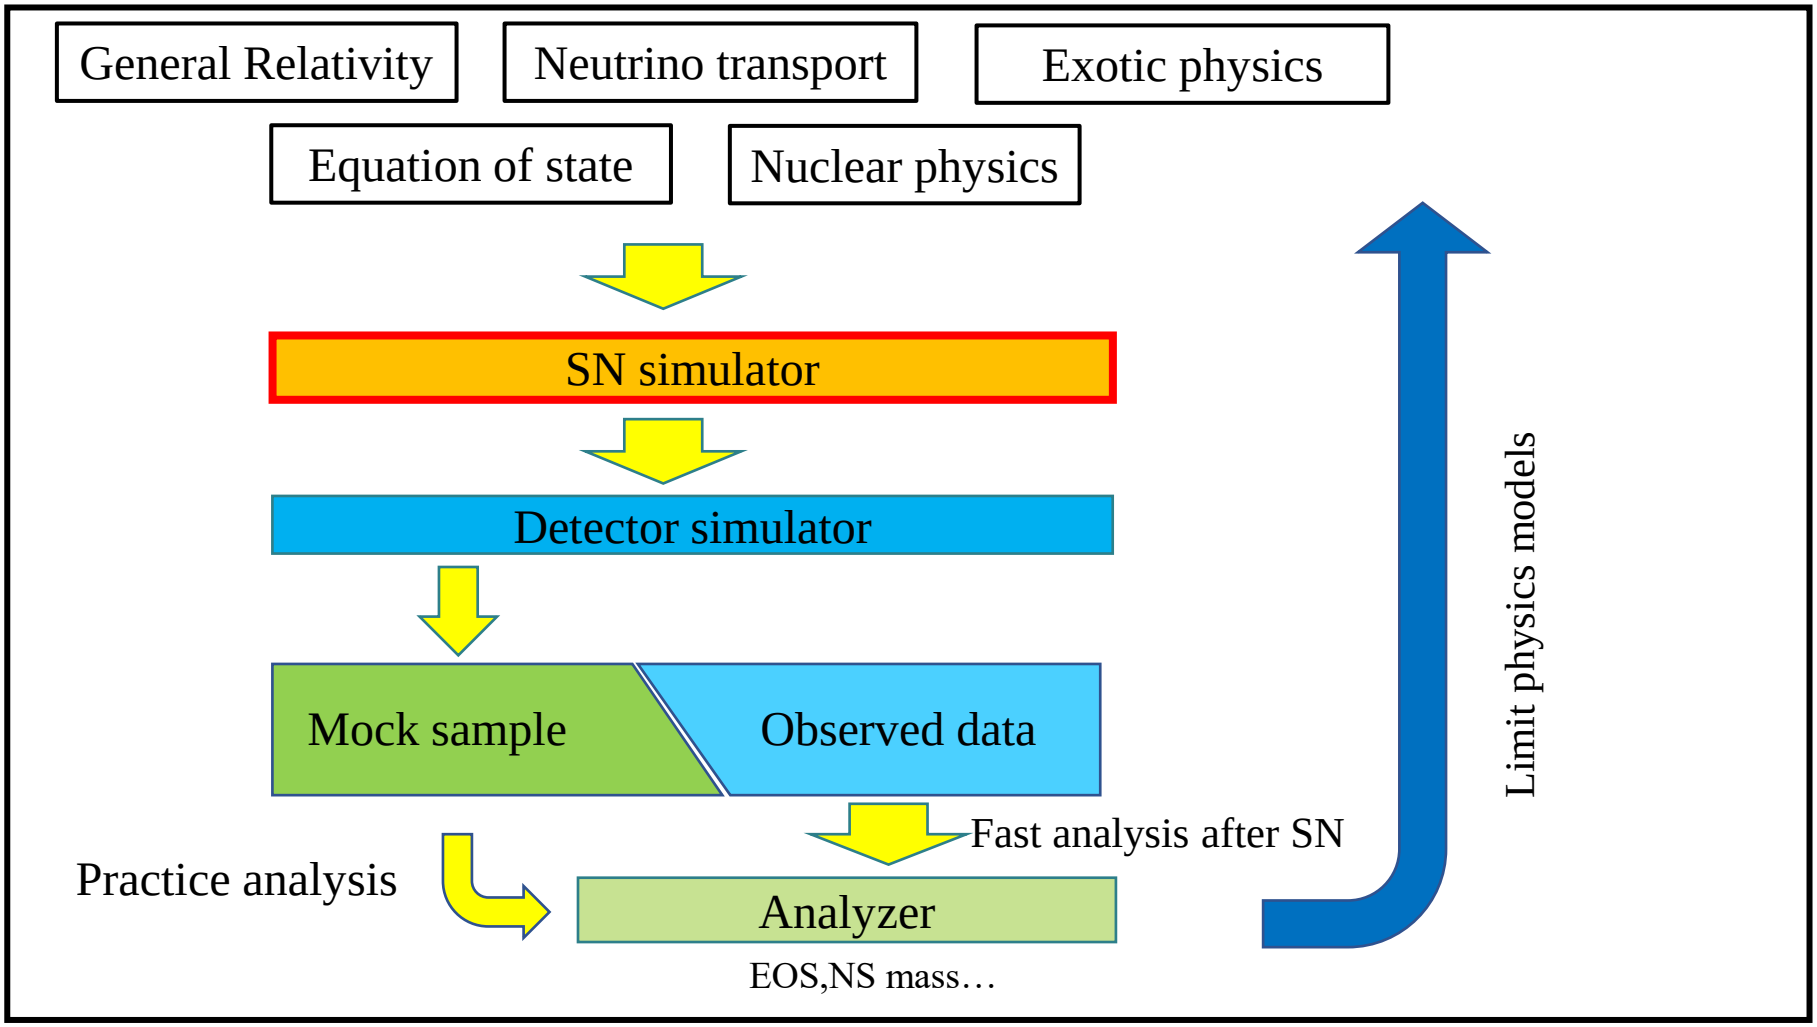
Example of simulation
Suwa et al. (2016)



We can compare theory and observation only for this time.

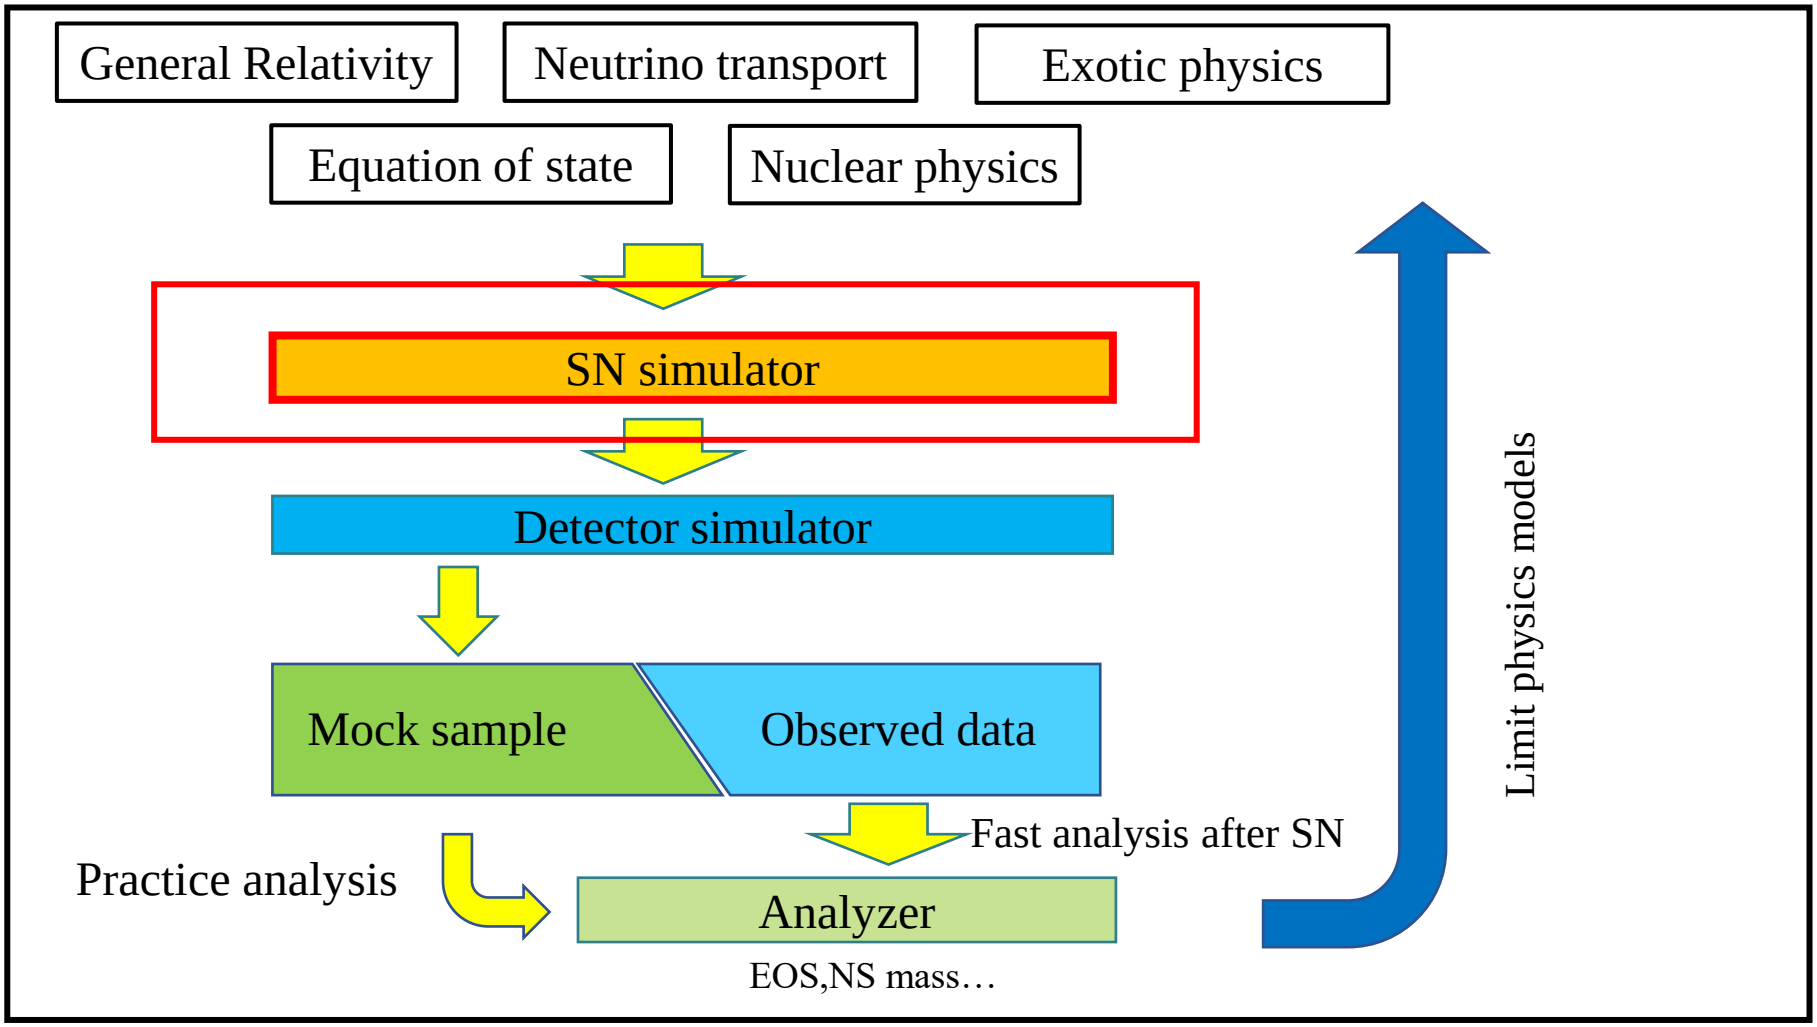
We will a long time simulation and an analysis framework.

Integrated framework



- Simulator which calculates from explosion to observation on earth.
- If a supernova is detected, the framework quickly analyze.

SN simulator



- Supernova simulation

Comparison of recent simulations

	Huedepohl (1D)	Fischer (1D)	Multi-dimension Takiwaki(2016), Suwa(2016)… etc	This study
Iron core	×	○	○	○
Natural explosion	○	×	○	○
Max time	20 s	20 s	< 1 s	**20 s**

- To explode without artificial methods in one-dimension is difficult
  - ➢ Enhancement of neutrino reaction rates
  - ➢ Removal of material accreting
- Long time simulation in multi-dimension is impossible
- We do long time simulation in one-dimension without artificial methods

Method of long time simulation

- Simulate supernovae in one-dimension
- Code
  - GR1Dv2 (public code: http://stellarcollapse.org)
  - O'Connor, ApJS 219 24 2015
  - Modified for long time simulation
    - ➢Resolved reference out of physics tables
    - ➢Optimized resolution of time and space
    - ➢Made a new suitable neutrino reaction table
- **Without artificial methods**

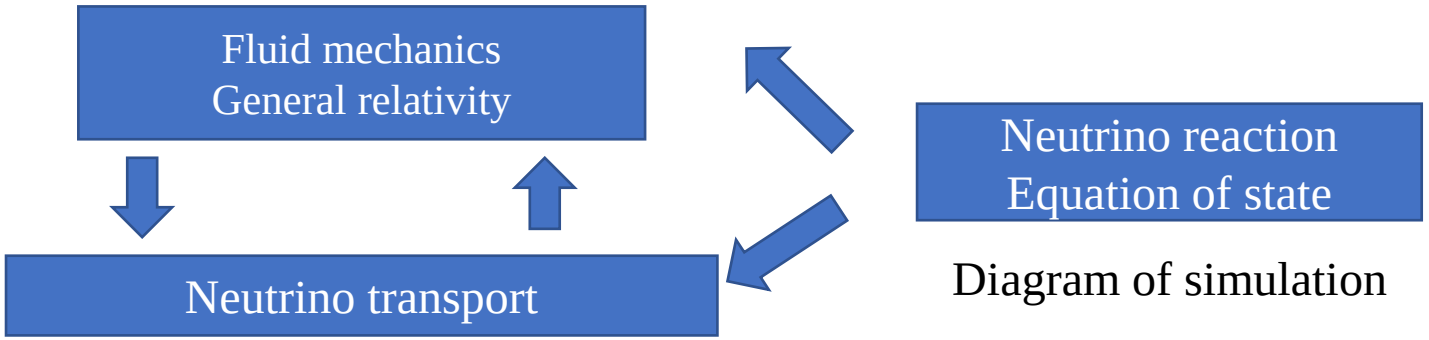


Diagram of simulation

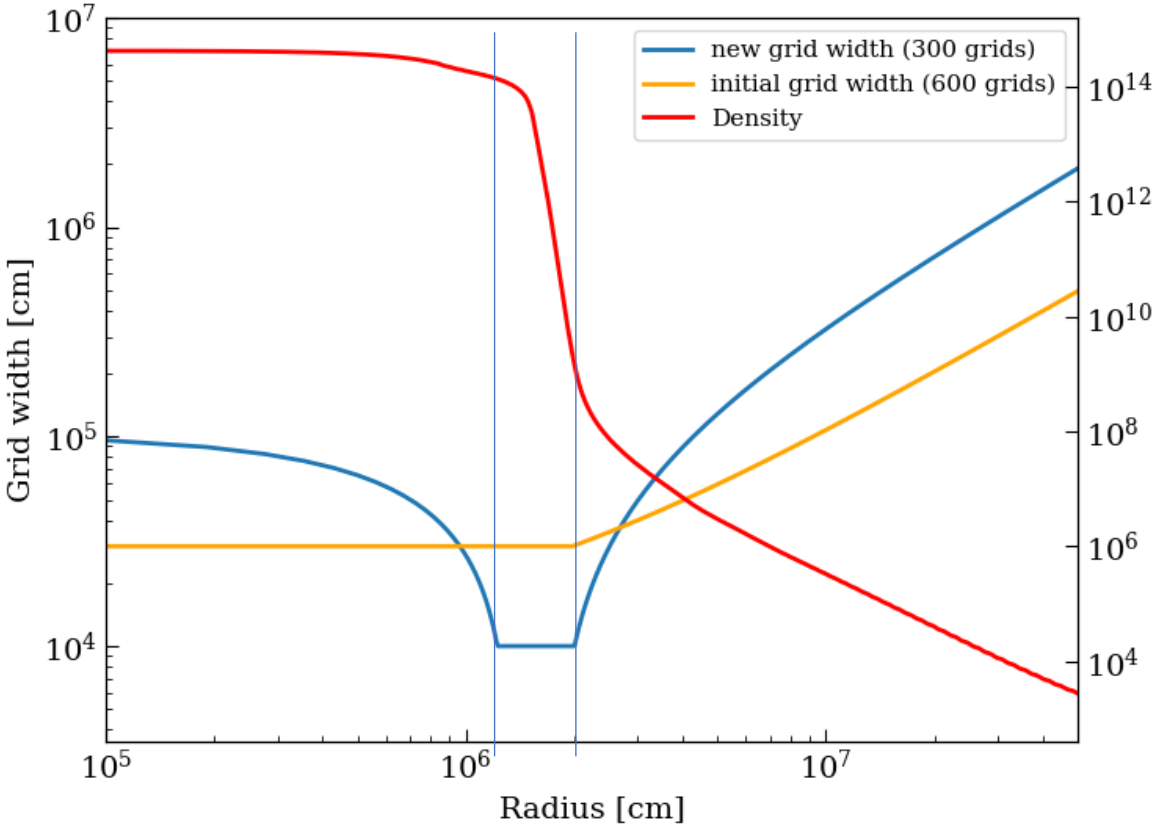
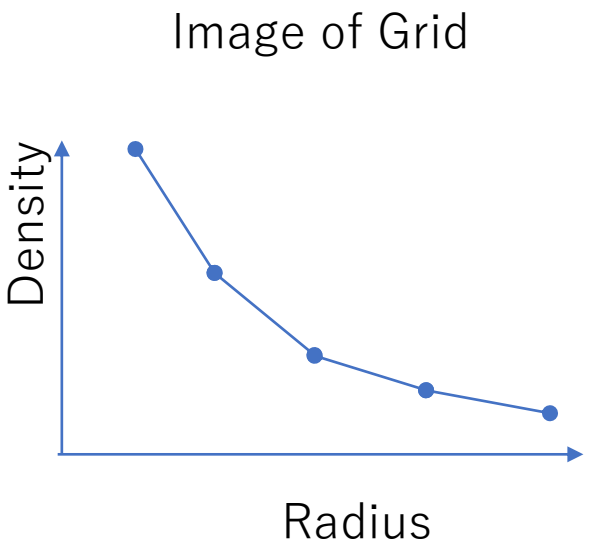
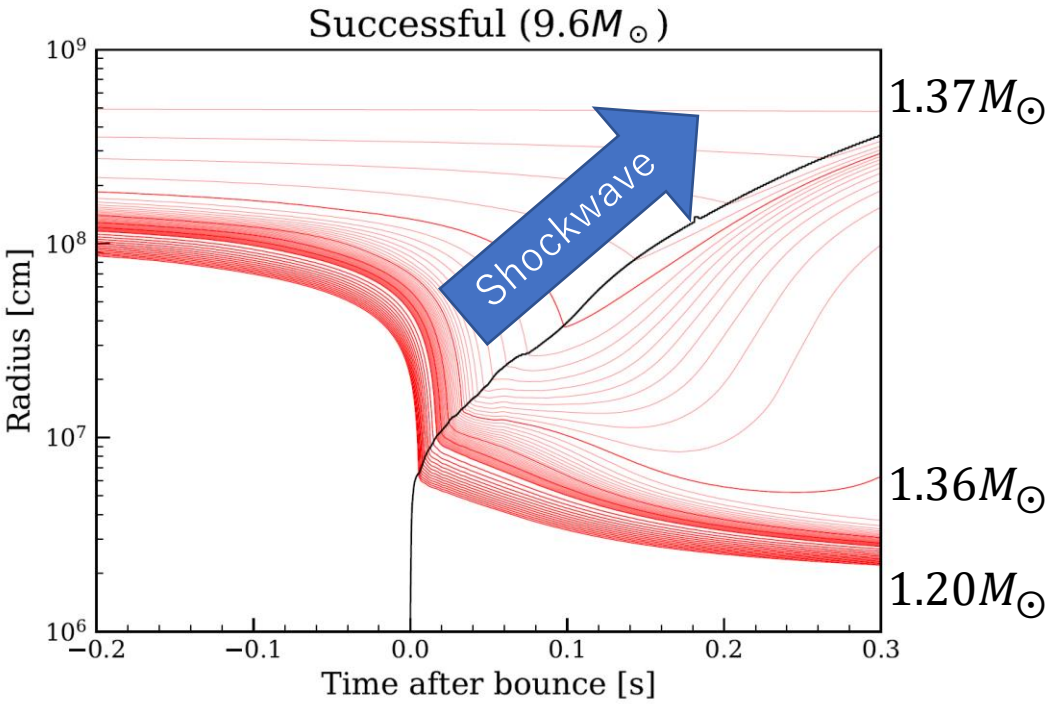
Device of grids

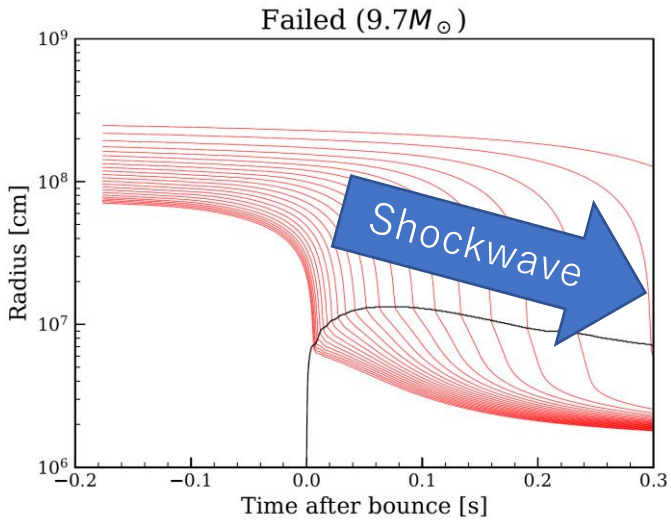




- Red：Density structure of PNS
- Yellow：Initial grids (600 grids)
- Blue：Optimized grids (300 grids)
- The region in which the density drastically changes is finely resolved.
  - ➢Initial grids make calculation stop at about 5 sec.
  - ➢Cost is also too high

Device of progenitors

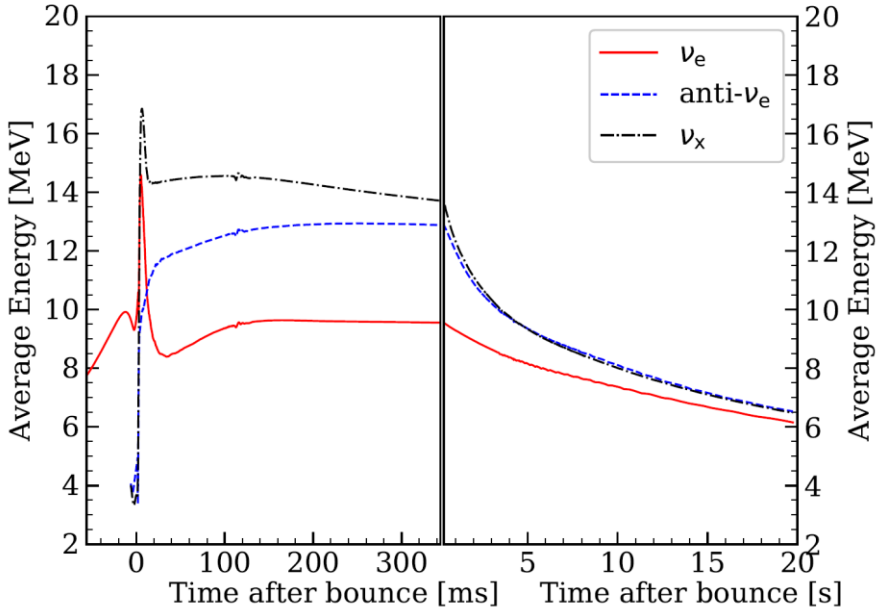




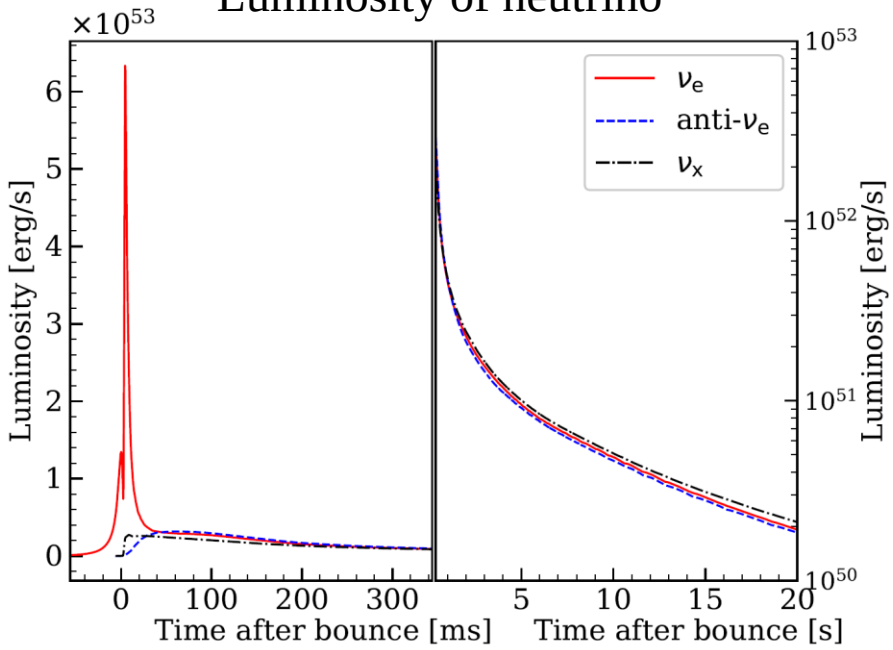
- Red：Radii at which densities are constant
- Black：Radius of a shockwave
- Succeed to explode with the suitable choice of progenitors and **without artificial methods**
  - ➢9.6 solar mss, initial metallicity is 0
  - ➢Called z9.6

Long time simulation

Average energy of neutrino



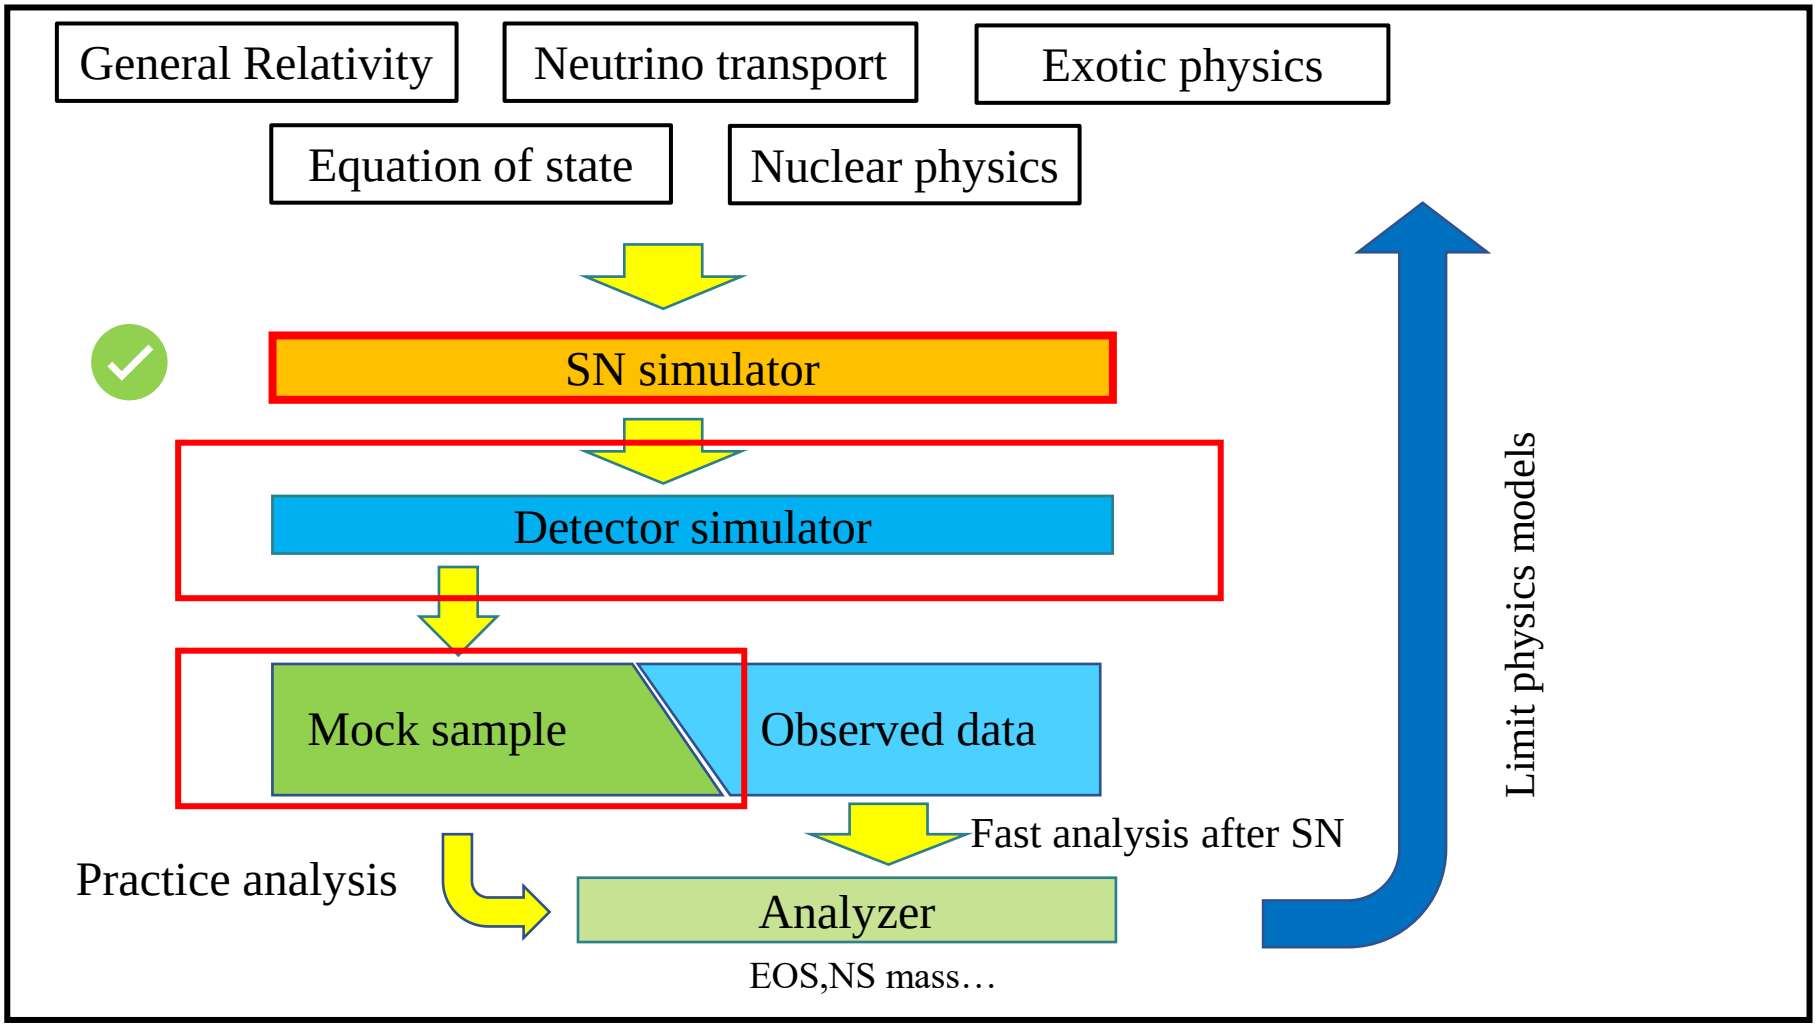
Luminosity of neutrino



ν_x : μ and τ (anti) neutrinos

- Average energies decrease from above 10 MeV to 6 MeV
- $\langle E_{\nu_e} \rangle < \langle E_{\bar{\nu}_e} \rangle < \langle E_{\nu_x} \rangle$
- Luminosities drecrease from 10^{53}erg/s
  - ➢These features agree with other simulations
  - ➢PNS cooling is calculated.

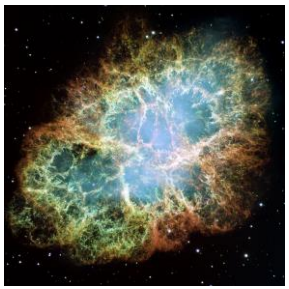
Detector simulator



- Detector simulation
- Simulates how signals of supernovae look like on earth
- Mock Sample is used for analysis practice and detector evaluation.

Event simulation

Explosion



H_2O
× 32.5 kton

Assumed Super-Kamiokande

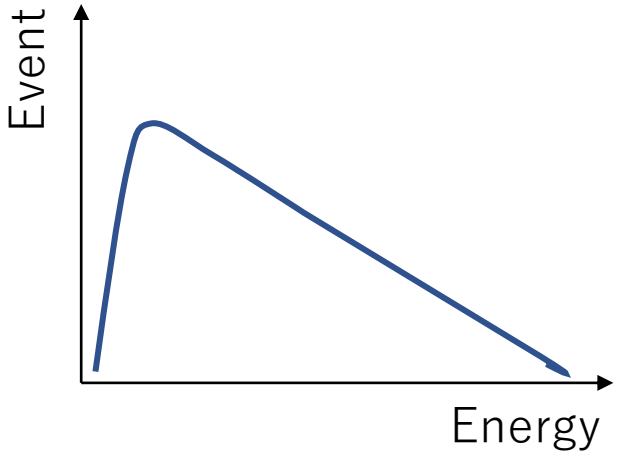
Reaction channel

Inverse Beta Decay(IBD)

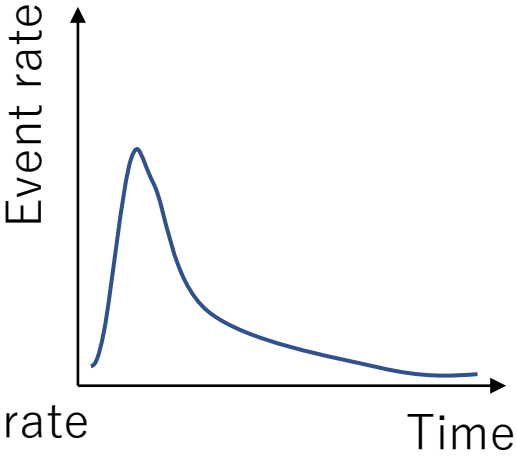
- $\bar{\nu}_e + p \rightarrow e^+ + n$
- Amount: more than 90%
- Direction sensitivity：No

Electron scattering(ES)

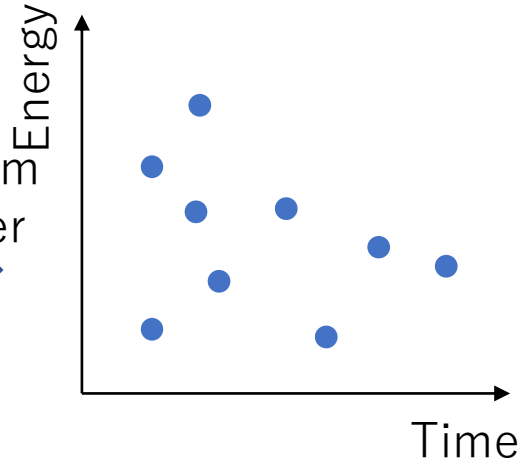
- $\nu + e^- \rightarrow \nu + e^-$
- Amount: 1/20 of IBD
- Direction sensitivity：Yes



Event distribution per a time

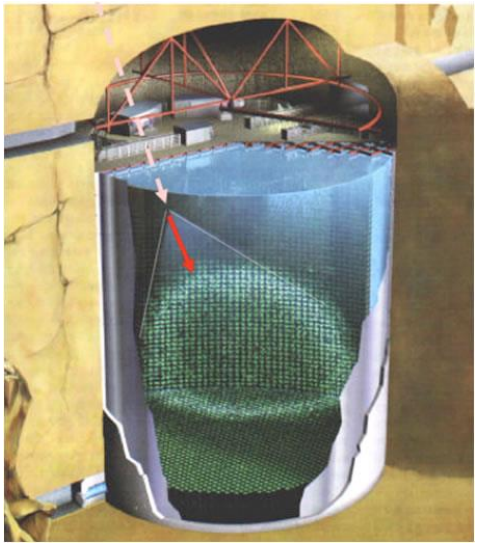


Random number



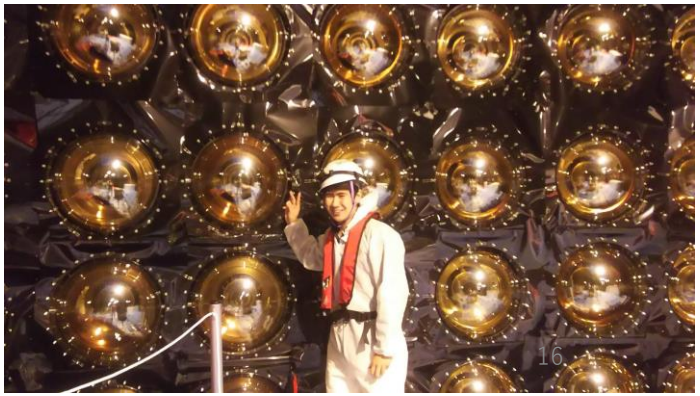
Super-Kamiokande(SK)

- Water Cherenkov detector in the Gifu prefecture.
  - Height: 41.4 m
  - Diameter: 39.3 m
  - Inner dector: 32.5 kton
  - Number of PMTs:11,129
  - Energy threshold: 5MeV
- Various neutrino studies
  - atmosphere, solar , accelerator…

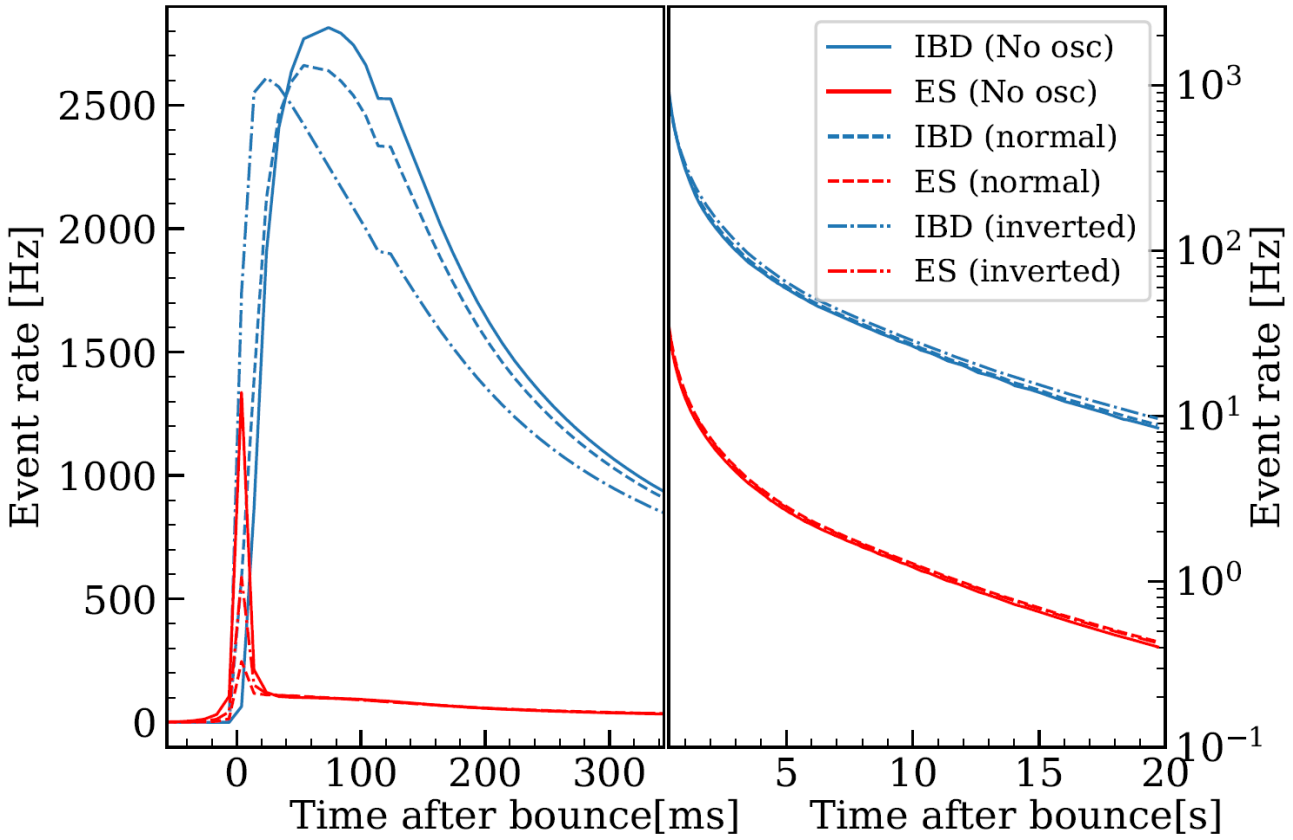


http://www-sk.icrr.u-tokyo.ac.jp

- Monitoring supernovae for 24 hours
  - If galactic supernovae happen, it is predicted to detect from 2,000 to 7,000 events.

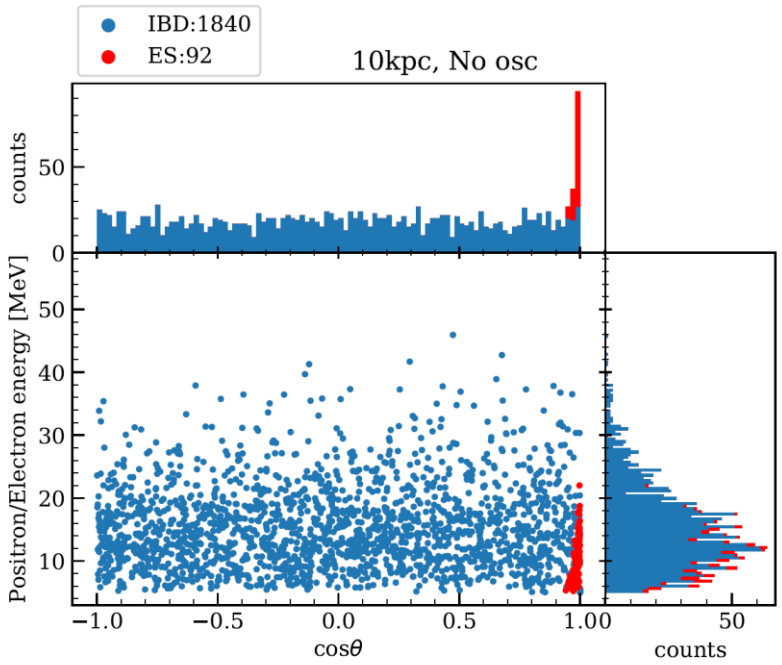


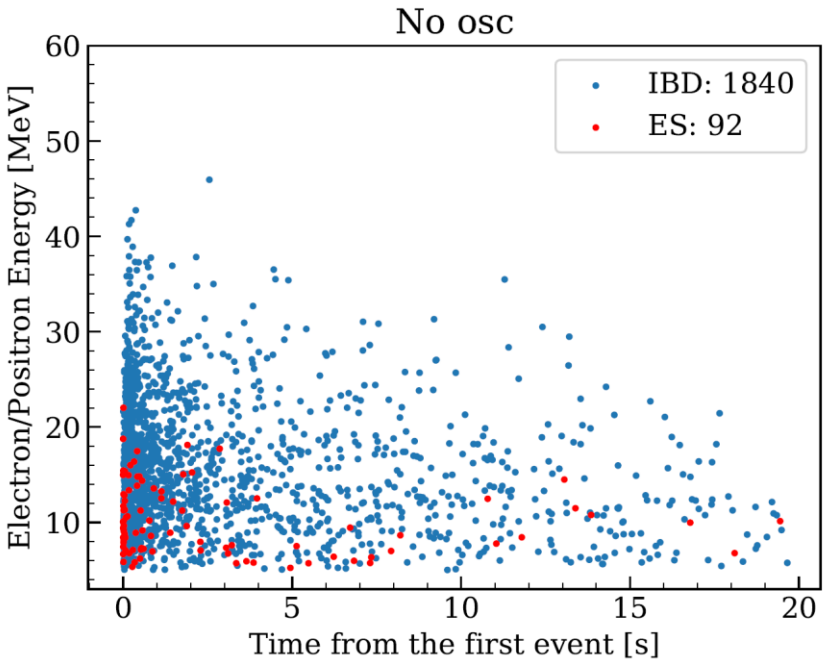
Reaction rate



- Assumed a supernova happen at 10 kpc（Distance to the galactic enter: 8kpc）
- About 2,000 events at 20 seconds
- In the later time, neutrino oscillation has little influence

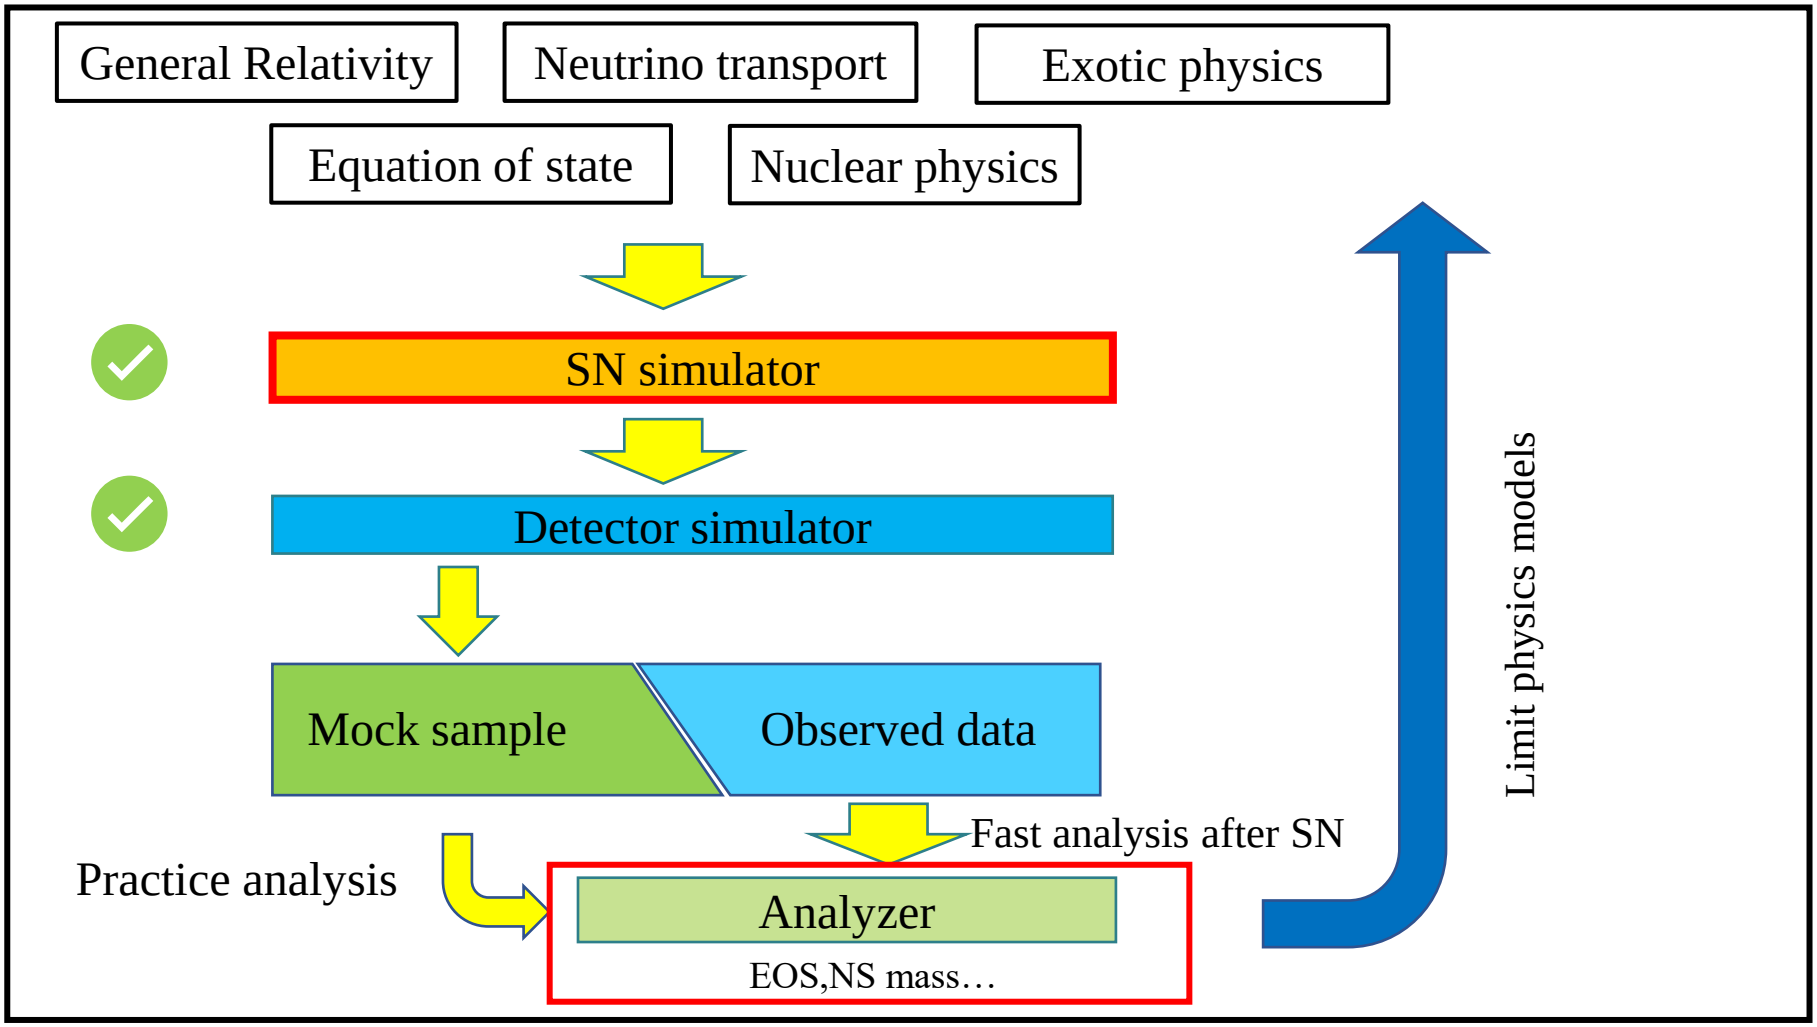
Scatter plot (Mock sample)





- Each event is simulated with random number (10kpc)
- Left：cosine distribution between neutrinos and charged leptons.
- Right：Time evolution of energy
  - ➢Almost all IBD, ES scatters forward.
- **Mock samples are applied for various studies**
  - ➢Development and practice of analysis methods
  - ➢Evaluation of SK

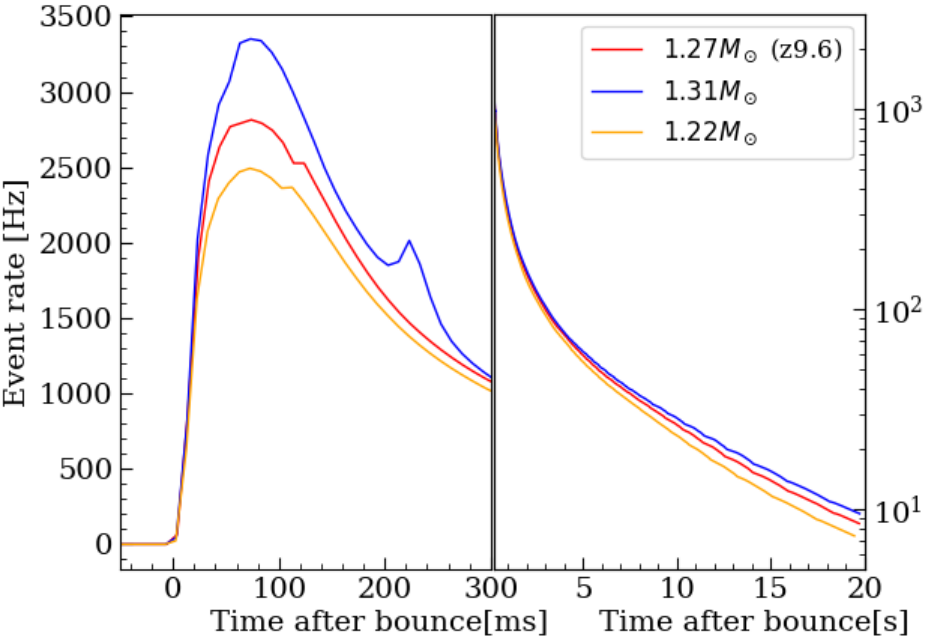
Analyzer



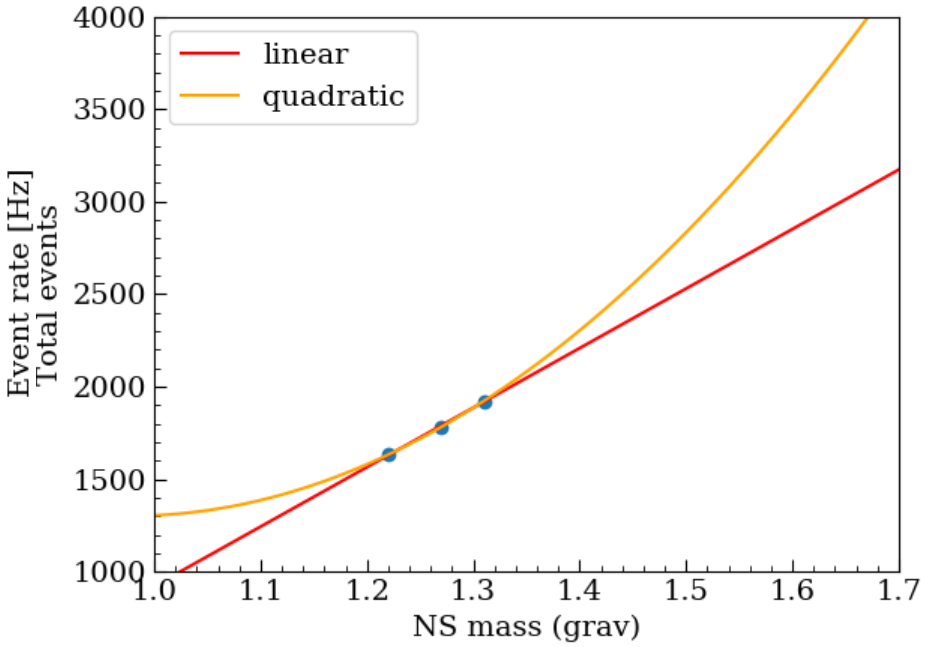
- Proposal and performance of analysis
  - ➢Under development

Neutrino and neutron star mass

Event rate at 10 kpc



Relation between the number of events and neutron star mass



- Three simulations which lead to different neutron star mass
- If distance is determined, neutron star mass is maybe determined.
  - ➢More simulations are needed.

Summary

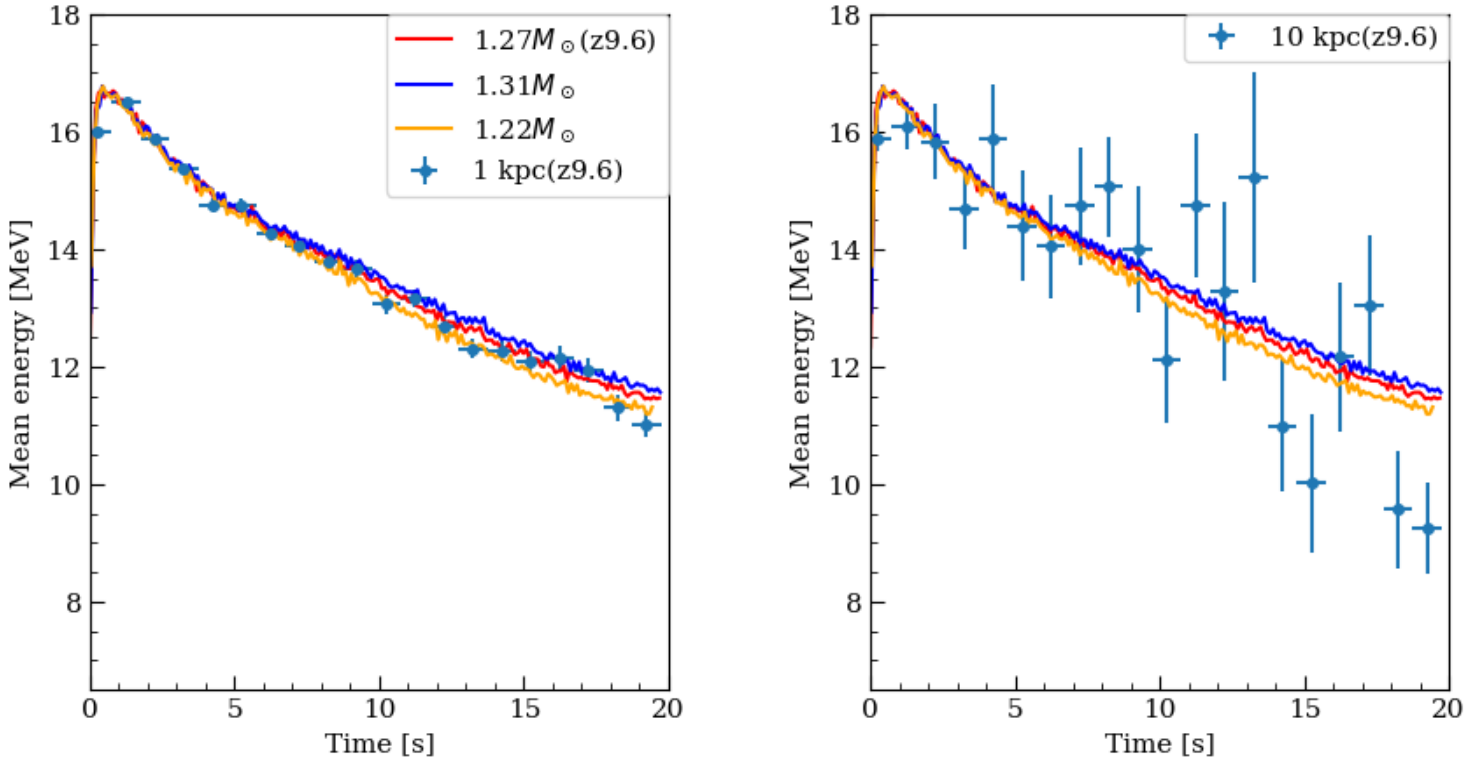
Today, neutron star workshop

- Supernovae give birth to neutron stars
- Established the long time simulation
- Estimated neutrino signals at Super-Kamiokande

Long time simulation of supernovae is important

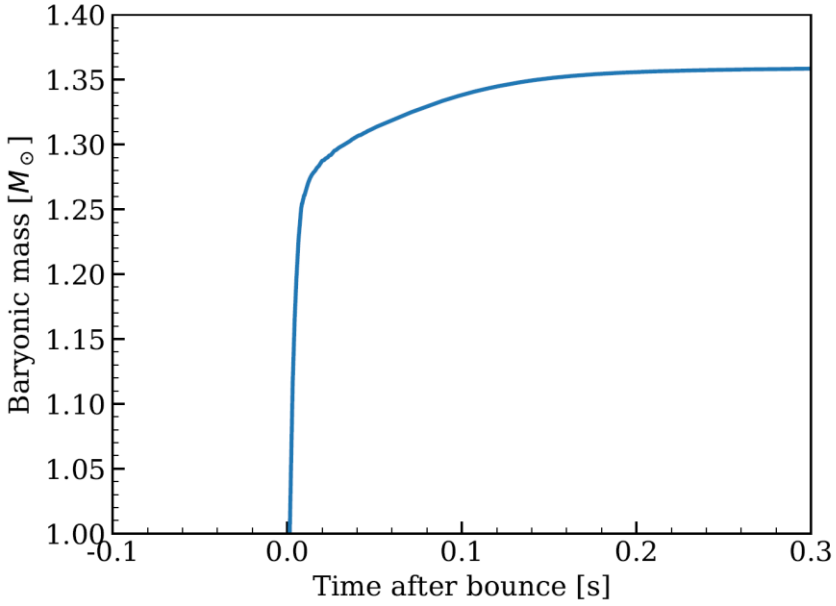
Back up

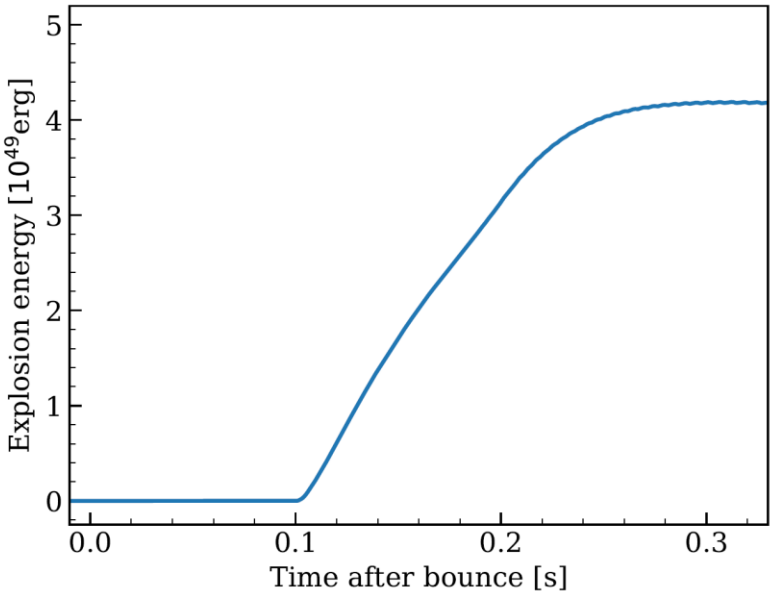
平均エネルギーの発展



- **実線**:無限個のイベントの平均エネルギー
- **マーカー**:有限個のイベントの平均エネルギー(z9.6)
  - ➢エラーバー: $\sqrt{\frac{1/N_{\mathrm{bin}} \times \sum_{i=1}^{N_{\mathrm{bin}}} (E_i - \bar{E})^2}{N_{\mathrm{bin}}}}$
- 個数だけでなく、エネルギー情報も使った比較が可能
- エネルギーの時間発展からのモデルの分別を目指す。

中性子星の質量と爆発エネルギー





- 中性子星の質量は$1.36M_\odot$
  - 典型的な質量は　$1M_\odot$~$2M_\odot$
- 爆発エネルギーは4×10^{49}erg
  - 典型的は10^{50}erg
  - 少し小さいが、10^{49}erg程度の超新星爆発も見つかっている。

生成・消滅

$$\nu_{\rm e} + n \leftrightarrow p + e^-,$$
$$\bar{\nu}_{\rm e} + p \leftrightarrow n + e^+,$$
$$\nu_{\rm e} + (A, Z) \leftrightarrow (A, Z+1) + e^-,$$

弾性散乱

$$\nu + \alpha \rightarrow \nu + \alpha,$$
$$\nu_{\rm i} + p \rightarrow \nu_{\rm i} + p,$$
$$\nu_{\rm i} + n \rightarrow \nu_{\rm i} + n,$$
$$\nu + (A, Z) \rightarrow \nu + (A, Z),$$

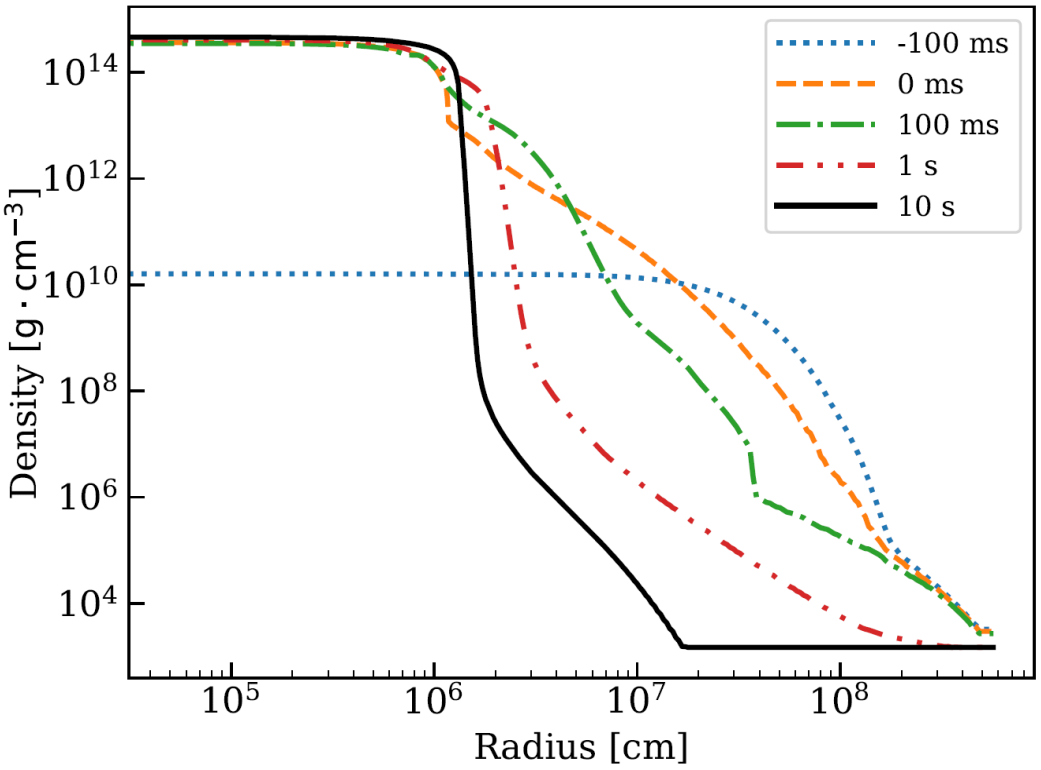
非弾性散乱

$$\nu_{\rm i} + e^- \rightarrow \nu_{\rm i}' + e^{-\prime},$$

熱化過程

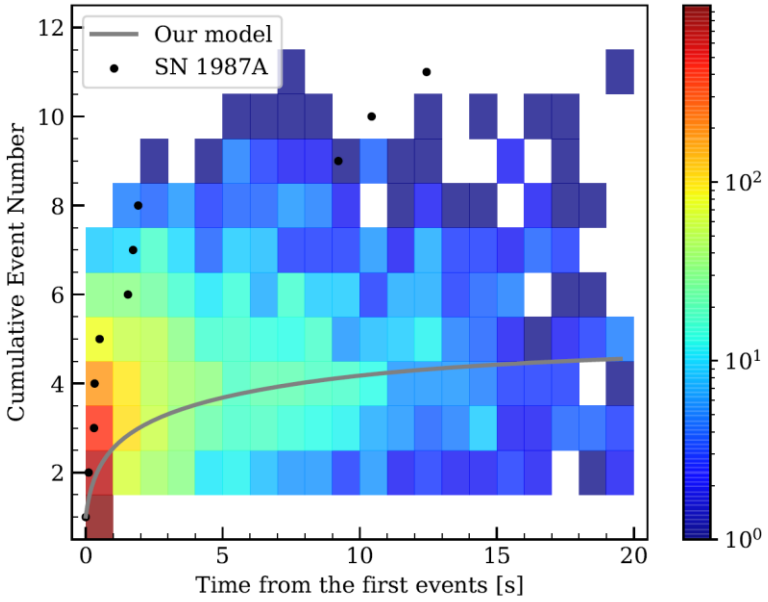
$$e^- + e^+ \rightarrow \nu_{\rm x} + \bar{\nu}_{\rm x},$$
$$N + N \rightarrow N + N + \nu_{\rm i} + \bar{\nu}_{\rm i},$$

バリオン密度プロファイル

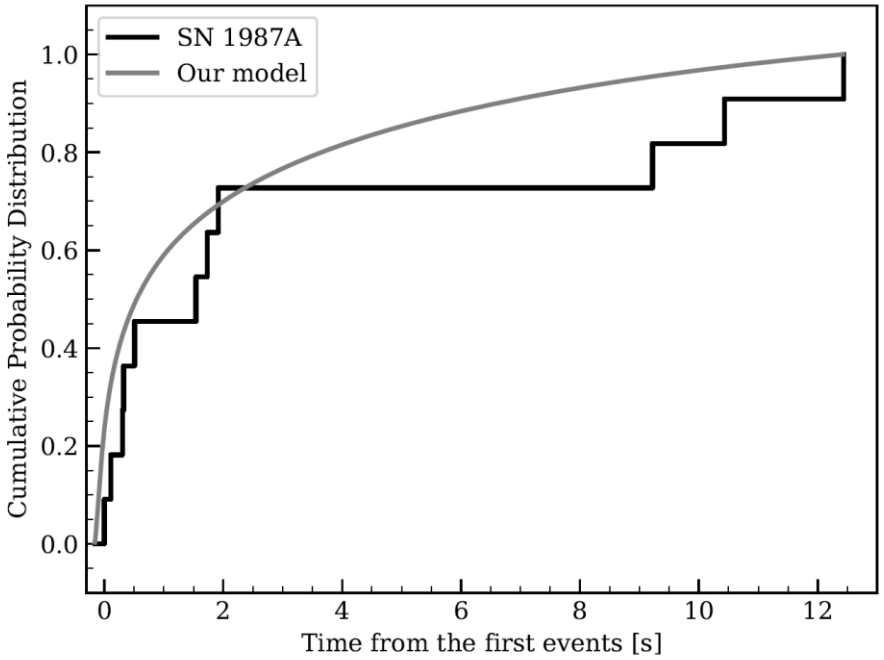


イベント数によらない解析(KSテスト)

累積イベント数



KSテスト



- 規格化したイベント数の発展を比べると距離によらない比較が可能
  - 例としてSN1987Aと比較を行っている。

ニュートリノ振動

- MSW効果,
- Normal hierarchy

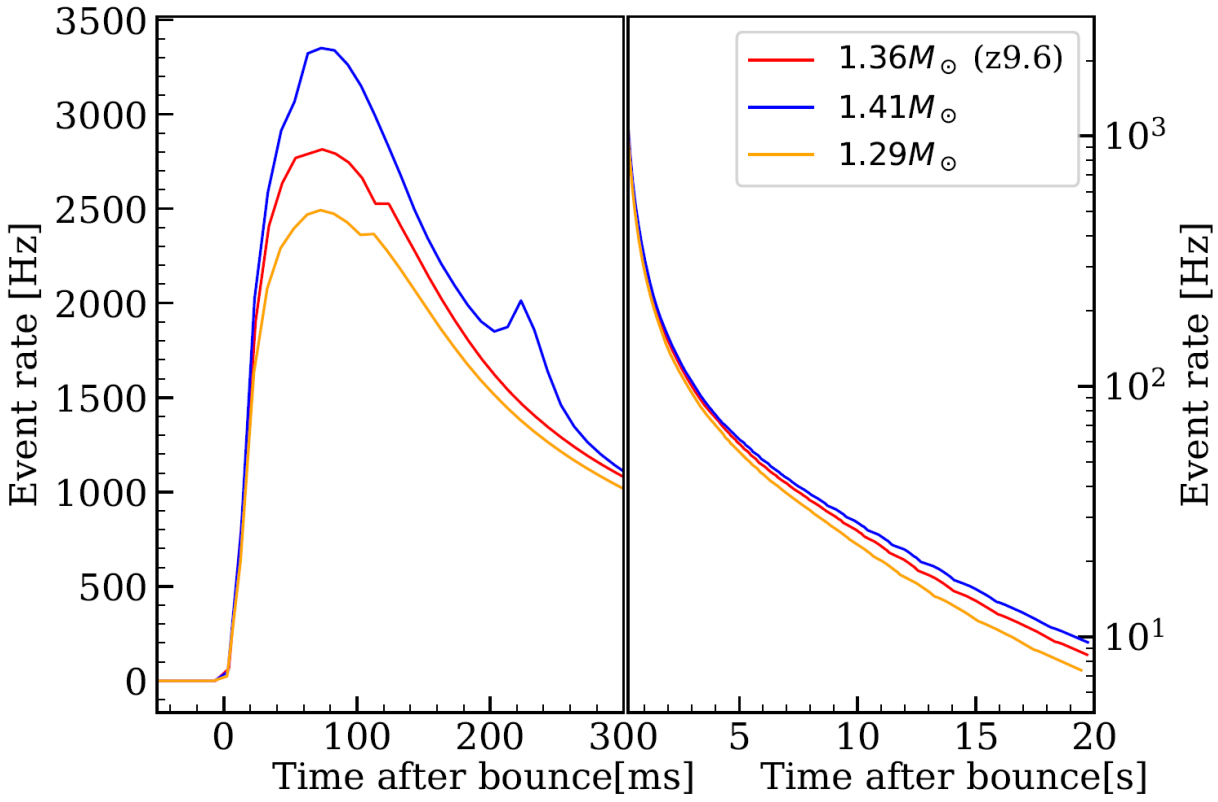
$$
\begin{aligned}
F'_{\nu_{\rm e}} &= F_{\nu_{\rm x}}, \\
F'_{\bar{\nu}_{\rm e}} &= pF_{\bar{\nu}_{\rm e}} + (1-p)F_{\nu_{\rm x}}, \\
4F'_{\nu_{\rm x}} &= F_{\nu_{\rm e}} + (1-p)F_{\bar{\nu}_{\rm e}} + (2+p)F_{\nu_{\rm x}},
\end{aligned}
$$

- Inverted hierarchy

$$
\begin{aligned}
F'_{\nu_{\rm e}} &= (1-p)F_{\nu_{\rm e}} + pF_{\nu_{\rm x}}, \\
F'_{\bar{\nu}_{\rm e}} &= F_{\nu_{\rm x}}, \\
4F'_{\nu_{\rm x}} &= pF_{\nu_{\rm e}} + F_{\bar{\nu}_{\rm e}} + (3-p)F_{\nu_{\rm x}},
\end{aligned}
$$

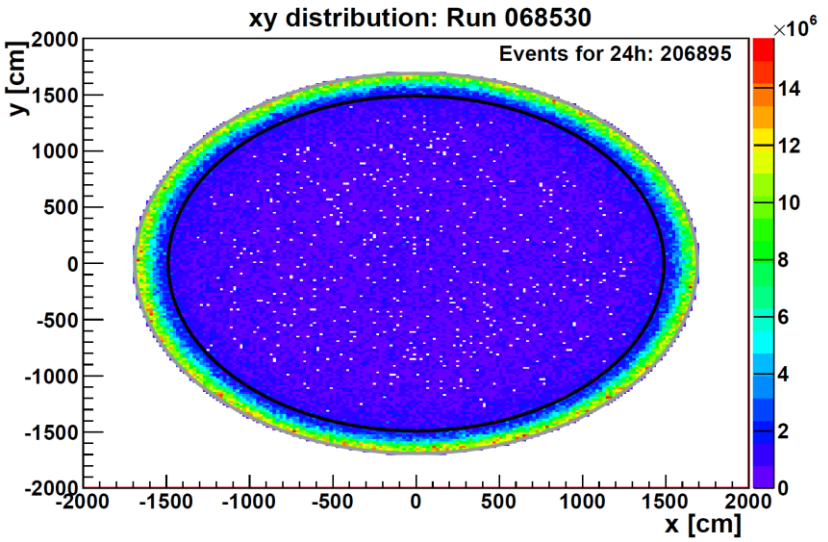
- $p = 0.69$

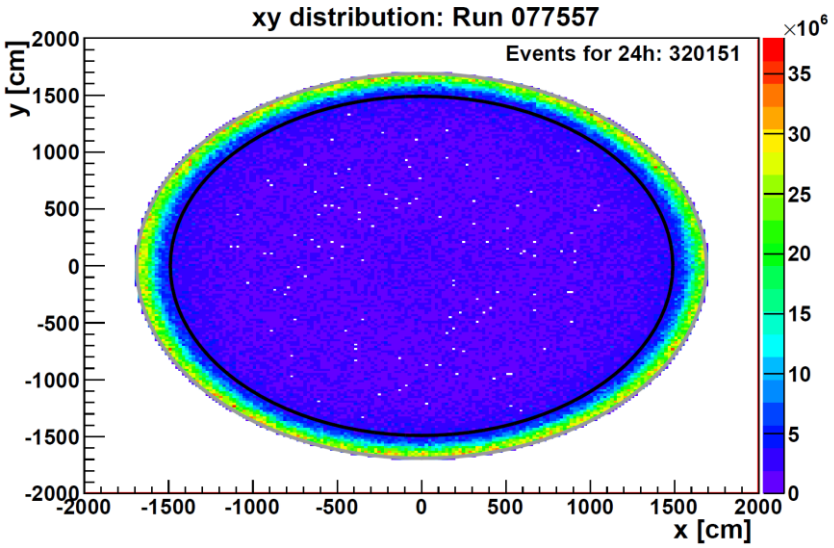
中性子星質量によるイベントレートの違い

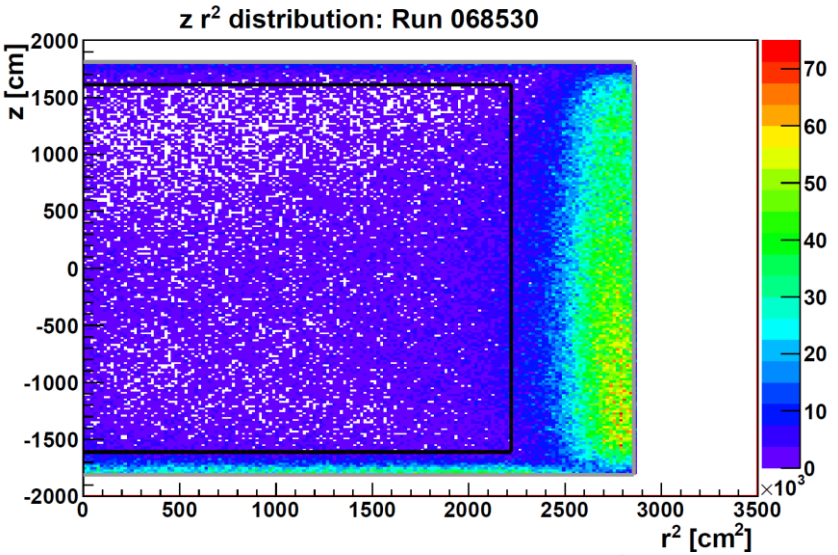


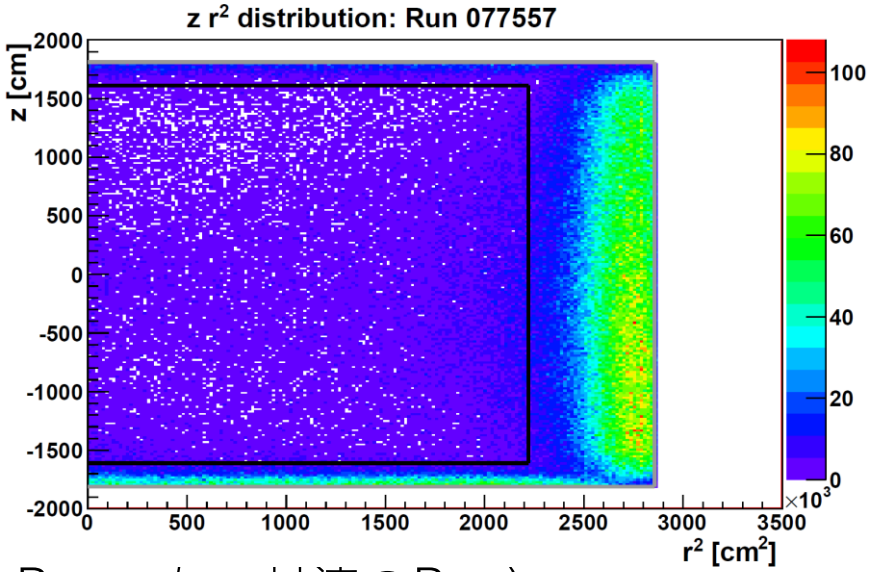
- 中性子星の質量が多くなるほど、イベントレートが高くなる傾向にある。

位置分布(実データ)



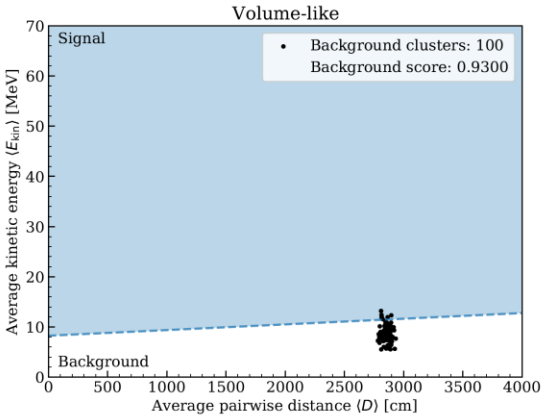


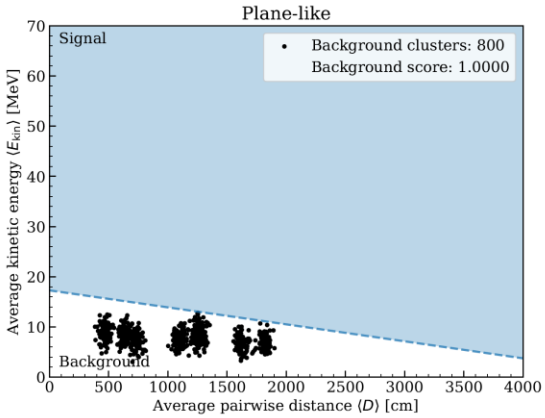


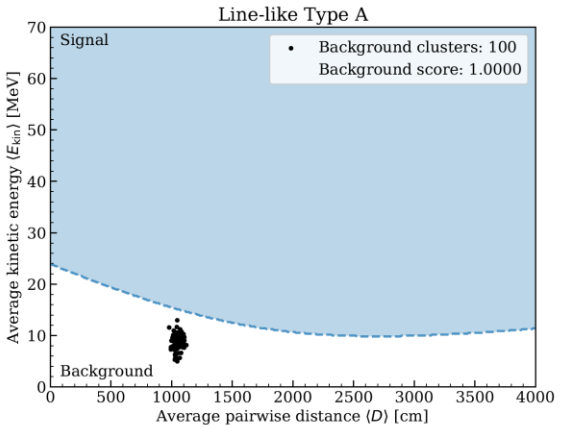


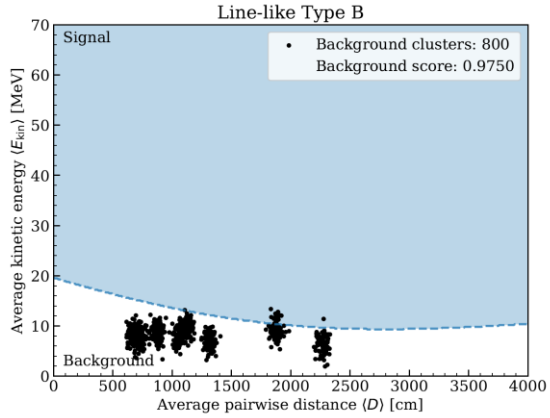
- 2種類のRunを使用(右：典型的なRun、左：対流のRun)
- FVの外だと急激にBGが増える。

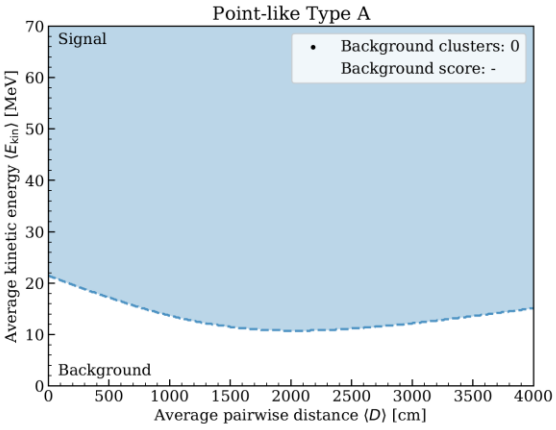
Background estimation

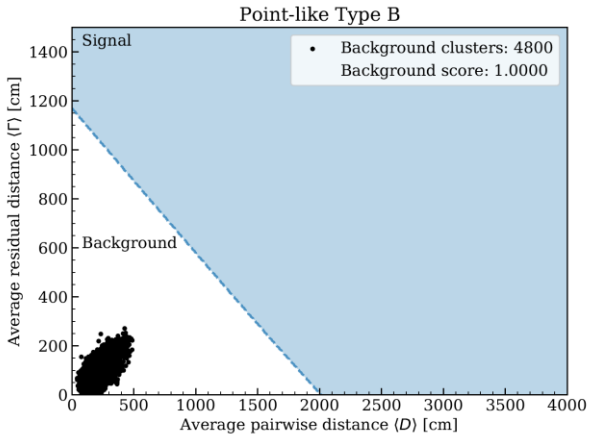












- Spallation cut後のデータからクラスターを探す。
- 同様に分解能を考え100倍に増やした。
- Signal regionに入るクラスターは27個
  - $\frac{27}{204.8\ \text{days} \times 100} \times 365 = 0.4812\ \text{year}^{-1}$
