Hello Everyone,

As many institutions', and individual's, involvement is beginning to transition from a hardware development focus to preparations for day one running, we are wanting to organize a short sPHENIX summer school. This school is currently being planned to be held at BNL (hybrid over zoom) for two days directly following the collaboration meeting, May 26<sup>th</sup> and 27<sup>th</sup>. This school will be split over two days with one focusing on providing a wider overview of the complete sPHENIX detector system, and the other focusing on physics interests and ongoing efforts/needs for the various topical groups, as well as a software tutorial to help attendees become familiar with the sPHENIX computing environment. In addition we anticipate a talk from the DE&I committee, and we plan to arrange a visit out to 1008 to see the under construction sPHENIX detector, as well as a casual dinner to enable attendees to get to know one another. This will be a great opportunity for new students or post-docs, as well as those who are transitioning from hardware projects, to become familiar with sPHENIX as a whole and become more involved in preparations for day one running.

Specific information with respect to the agenda will become available as the date approaches.

Anyone who is interested in attending please fill out registration at the link below:

## Motivation

This workshop will be a hybrid event and is not open to the public.

To complete the RHIC mission, sPHENIX was specifically designed to measure jet and heavy-flavor observables with a level of precision not previously achievable at RHIC. This will enhance our understanding of the quark-gluon plasma (QGP) properties and their temperature dependence beyond what is possible with existing and planned data from the LHC and other RHIC experiments.

A major goal of the sPHENIX program is to address the question of the approach to thermalization of the quark-gluon plasma and its transport properties using hard probes such as jets and heavy flavor. The current three-year run plan includes Au+Au, p+Au and p+p collisions at 200 GeV. The Au+Au dataset provides a large QGP system to study the QGP properties. The p+Au dataset will allow for additional studies of the intriguing behavior observed in flow measurements from other RHIC experiments as well as transport properties of cold QCD matter and proton/nuclear structure. The p+p collisions provide a necessary reference for Au+Au and p+Au collisions and also allow for additional studies of proton structure. Anticipated measurements include but are not limited to, jet substructure observables, photon and heavy flavor tagged jets as well as comparisons of the production of the different  $\psi$  states in all three collision systems.

To maximize the rich physics sPHENIX is capable of accessing, this workshop will enhance the discussions between the experimentalists making the measurements and the theorists whose models will be tested and constrained by the new data. Since sPHENIX will start taking data in early 2023, this workshop is timely for theorists wishing to make final predictions of anticipated observables before data collection commences. In addition, it will provide an opportunity for theorists and experimentalists to propose and discuss new observables.

This RBRC Workshop: Predictions for sPHENIX is not open to the public and we do not plan to record the proceedings. To be eligible to attend, all participants must register online by June 1, 2022. For questions or assistance with registering, please contact the [Workshop Coordinator](#).

## Important Dates

April 20, 2022	General registration opens
June 1, 2022	Registration closes
June 1, 2022	Additional <a href="#">guest registration</a> for non-U.S. citizens closes

## Workshop Information

**Dates:** July 20–22, 2022

**Event ID:** [0000004154](#)

**Workshop Venue**  
Brookhaven National Laboratory  
Upton, NY 11973 USA

[Meeting location and directions](#)
